Supplementary Figure 2: TTX does not increase cell death in the SC and the retina.
Pycnotic profiles were counted in the organotypic preparations stained with bisbenzimide (x40 objective, from 2 fields for the SC and the entire retina) at 4 DIV (a) and 12 DIV (b) in the superior colliculus (SC), the inferior colliculus, and the retina. The number of dying cells in the retina and SC was similar in the control and TTX treated condition (6 cultures per condition).
