Supplementary Figure-4(Hen)

The figure shows a bar graph with two groups: Standard and Enriched. The y-axis represents latency to feed (s), ranging from 0 to 225. The bars indicate that the latency to feed is significantly lower in the Enriched group compared to the Standard group. The graph includes error bars, and a statistical test marked with an asterisk (*) indicates a significant difference between the two groups. The legend indicates that the light gray bars represent Sham and the black bars represent X-ray.
