Supplementary Fig. 2: Tau did not distribute to a single neurite in αIR3 treated neurons. Double immunofluorescence micrographs showing the distribution of tau (green) and tub (red)-left, or MAP2 (green) and Tub (red)-right in hippocampal pyramidal neurons cultured for 48 h in control conditions (top) or in the presence of 1mg/ml of αIR3 monoclonal antibody (bottom). Fresh antibody was added to the cultures every 8 h. Calibration: 15 μm.
