Supplementary Figure 6: FFA responses to whole and scrambled images versus fixation.
Data were acquired at 1x1x1mm and are averaged across three subjects. Blue: Average response amplitude to whole images of a category versus the fixation baseline. Red: Average response amplitude to scrambled images of a category versus the fixation baseline. Error bars: SEM across subjects. X-axis: stimulus category. F: faces; A: animals; C: cars; S: sculptures. Asterisks: significantly larger than baseline, t-test across subjects, P < 0.05;
