Supplementary Figure 4. Model of regulation of endogenous *egl-15* exon 5s in sex myoblasts.

Top panel, in wild-type worms, ASD-1 and FOX-1 binds to the UGCAUG stretch in intron 4 to suppress selection of exon 5B and therefore downstream exon 5A is selected. Bottom panel, in the *asd-1; fox-1* double mutant, the UGCAUG stretch in intron 4 is not occupied and upstream exon 5B is preferred.
