Supplementary Figure 1: Photobleaching of YFP in fixed Vero cells expressing YFP only does not generate measurable “CFP-like” fluorescence. Cells were fixed with 4% PFA, which was subsequently neutralized with ammonium chloride. The cover slips were mounted either in Mowiol or in DAKO Fluorescent Mounting Medium before photobleaching of YFP. Line scans presented in the lower panels show no increase in CFP-like fluorescence after YFP photobleaching. Bars, 20 microns.
