

## Biodiversity: there's a role to be played by 'museum-keepers' too

SIR — Pierre L. Ibisch and colleagues, in Correspondence ("Biodiversity needs the help of global change managers, not museum-keepers" *Nature* 438, 156; 2005), suggest that conservationists should not focus on single-species approaches in conservation science and practice. But the concept of ecosystem function may be difficult to explain to the general public. Many non-scientific conservationists I know would be more willing to donate money to save 'cute' or impressive animals, such as the Florida panther or the aptly named resplendent quetzal, than to support a theoretical science-based concept such as ecosystem services.

Valuing single species does not rule out using the services aspect of ecosystems. Take ecotourism, for instance: a 'service' as defined by the international Millennium Ecosystem Assessment. A Guatemalan farmer may not care about the resplendent quetzal if he is hungry and destroying more forest will give him more agricultural land. But if the farmer is offered a share in ecotourism projects organizing tours for bird-watchers who wish to see the resplendent quetzal, he may work to preserve the forests.

Many conservation organizations — both applied and science-based — need to focus on a single species in order to raise public money and support. But successful conservation probably needs to include ecosystem function and services to be successful in the long-term. Strategists should ask themselves: What can we do? What can we explain to the broad public? What can we explain to the locals? And what goals can we realistically achieve?

In the end, we need to be both global change managers and museum keepers.

## Climate research opponent is not a friend to science

SIR — In your Editorial "Taking a stand on animal-rights violence" (*Nature* 438, 1; 2005) you suggest that US Senator James Inhofe (Republican, Oklahoma) should be applauded for supporting legislation that would make it easier to protect researchers against the threat of violence from animal-rights activists.

Some readers might get the impression

from your Editorial that Inhofe is a friend of science and scientific research. I strongly disagree with this.

This is the same Inhofe who has told the US Senate, and repeats on his website, that the threat of catastrophic global warming is the "greatest hoax ever perpetrated on the American people". He has worked hard to discredit legitimate research in this area (see <http://inchofe.senate.gov/pressreleases/climateupdate.htm>) and has fought to exclude the findings of such research from public policy in the United States. He is co-sponsor of the Bush administration's energy bill (see <http://thomas.loc.gov/cgi-bin/query/z?c108:s485>) which you have previously — and justifiably in my opinion — characterized as inadequate (*Nature* 435, 247; 2005). Inhofe has also taken strong stands against "all types of cloning" and has called embryonic stem-cell research "inconsistent and unreliable and ... unethical" (see <http://inchofe.senate.gov/pressreleases/content-healthcare.htm>).

Any calls to applaud Inhofe should be considered in the context of his broader — and in my view much more negative — record on scientific issues.

## Languages: Europe puts its money where its mouth is

SIR — Your News Feature "Tongue tied" (*Nature* 438, 148–149; 2005), drawing attention to endangered languages, was very welcome, but in focusing on US research it overlooked the main work done in this area.

By far the largest investments in endangered-language research have been made by European institutions rather than US ones. Consider, for example, the ongoing investment by the Volkswagen Foundation (\$12.75 million and still rolling) and the Lisbet Rausing Charitable Fund (\$34 million invested through the School of Oriental and African Studies, London).

Even the research on the Siberian language Tofa that was reported in your News Feature was undertaken with Volkswagen funding: it is part of 5 terabytes of data now archived in [www.mpi.nl/DOBES](http://www.mpi.nl/DOBES) at the Max Planck Institute for Psycholinguistics.

In general, I believe that *Nature's* coverage of language and linguistics is relatively poor — a shame, as this is arguably the most advanced area of research in the humanities and it is developing fast.

## Languages: land may speak louder than words

SIR — Your News Feature "Tongue tied" (*Nature* 438, 148–149; 2005) shows that field linguists often attempt to save indigenous languages and the information embedded in them by gathering words into dictionaries and grammar texts. This process has an underlying assumption that words mean 'things', and that, once saved, they can be reassembled with the proper grammar to represent experiences.

This perspective is natural for people with a written language, but for many indigenous people, experience bears its own expression and names are 'written' in the terrain. Thus, saving a language may be more dependent on conserving the place in which the language arises.

This became apparent to me in a conversation I had with an indigenous woman from Alaska. Her language, Eyak, is also disappearing: only one old woman now has it as her primary language. While her speech is being recorded and children are encouraged to converse with her, this grandmother is not worried about the demise of Eyak. The elder's advice is to learn the common syntax and grammar of another Athabaskan language, such as Dine, and to return to the land where "the words will be available in the surroundings".

## Taxing question of when ethics go up in smoke

SIR — In News in Brief ("Research centre refuses tobacco-company funding" *Nature* 438, 271; 2005), you report that the German Cancer Research Centre (DKFZ) has adopted "an ethical code that bans all kinds of funding from tobacco companies". To me this sounds sanctimonious, because — as a member of the country's largest research institution, the Helmholtz Association — the DKFZ is funded almost entirely through taxes.

In 2003, the German federal government received €14.1 billion (US\$16.6 billion) in revenue from tobacco taxes, which amounts to 3.4% of the country's total tax income. As Dr Pötschke-Langer of the DKFZ hopes to "set an example for other German health institutes", I wonder if the DKFZ aims to convince the Helmholtz Association to do without the €74.8 million that represents 3.4% of its annual €2.2-billion funding, or even to renounce 3.4% of its own budget?
