Micron accuracy

The 'incise' process from Renishaw, specialists in industrial and CAD/CAM technologies, focuses on the accuracy of crown and bridge framework manufacture from start to finish.

The metal-free CAD/CAM system measures human error and the introduction of micron accuracy ensures correct restorations every time.

Chair time is reduced during final crown and bridge fitting appointments, while the restoration's resistance to tooth decay and staining is increased, resulting in a longer, lasting restoration.

The metal free benefits of the incise process eliminate the occasional problems when using metal crowns where oral tissues react with the restoration causing gum recession, exposing unattractive metal collars prone to tooth decay and staining. Renishaw's incise crowns and bridges are made with a bio-compatible zirconia ceramic core which provides a strong framework, achieving excellent aesthetics, giving the look and function of natural teeth.

Super-smooth finish

Dentsply Ash Instruments has introduced a range of zirconium nitride coated restorative instruments to help get the best finish working with composite materials that can sometimes stick to the placement instrument.

The range includes over 20 instruments, on three handle choices, Lustra, Cearnicolor and Flexichange. Although the pale

Antimicrobial agent

Chlorhexidine Gluconate Medicated Mouthwash from Blackwell Supplies is the generic equivalent of Corsodyl. Chlorhexidine gluconate is a well-proven antimicrobial agent which reduces the formation of plaque and combats gingivitis and oral candida infections.

Chlorhexidine Gluconate Mouthwash is recommended for both pre- and post-operative use in the rapidly expanding areas of endodontics and dental implants, where leading dental specialists are increasingly exploiting its qualities to reduce infection and minimise patient discomfort. It is available in

Original, Peppermint or Aniseed flavour to meet the needs of every patient.

Treatment for periodontal pockets

Chlo-Site from Oraldent, is a new, simple, and efficient, safe way to treat periodontal pockets. Chlo-Site is a gel with 1.5% chlorhexidine that is capable of assuring both active and passive disinfection coverage at the site where it was applied for up to two weeks, its maker claims.

Chlo-Site, to be used in conjunction with srp, remains microbiologically active for a minimum of 15 days with effective concentrations of two types of chlorhexidine, chlorhexidine digluconate – slow release 0.5% and chlorhexidine dihydrochloric – rapid release 1.0%. This combination makes the bactericidal activity of Chlo-Site 40 – 60

times greater than the Minimum Inhibiting Concentration (MIC) for the pathogenic bacteria usually in periodontal pockets within the first week.

Its easy and ready to use gel is supplied in disposable syringes and can be applied directly into the periodontal pocket with the special periodontal needle provided for fast, accurate treatment of periodontal pockets.

gold coloured zirconium nitride coating is so thin it adds no bulk to the instrument, it gives the instrument a super-hard, super-smooth finish.

The smooth finish means that the tip is very "non-stick", much more than the older-style anodised aluminium instruments. The coating hardness will also ensure the instrument does not become scratched, thereby staying smooth for longer.

RESTORATIVES

Aesthetic resin cement

Calibra, the aesthetic resin cement from Dentsply is designed to simplify your cementation needs for indirect cosmetic restorations. Calibra is simple-to-handle and is available as a paste system in five shades - translucent, light, medium, dark and opaque, providing a broad spectrum of shading possibilities.

Calibra's choice of catalyst paste viscosities means that you get the right handling for the right application. It can be used easily in all modes of curing - light cure and dual cure and it sticks to your brush for easy lift-off.

The Calibra system, including Prime&Bond NT dual cure, provides mechanical properties for long-lasting strength. The unique resin matrix in Calibra cement gives strength and aesthetics and it can be used for inlays/onlays, veneers, crowns and bridges - and any cosmetic indirect restoration that demands aesthetics and strength.

Easy to use syringe

Blackwell Supplies offers a wide range of practical solutions for the dental profession including the effective and easy to use Rotor Syringe range to its customers. Designed to eliminate the use of barbs, the Rotor S/A Syringe uses the elasticity of the cartridge and thumb disk to induce carefully and easily controlled aspiration.

Translucency and aesthetics

Fuji VIII is a glass ionomer cement with physical and aesthetic properties which can be used for Class III, V and root surface restorations. GC Fuji VIII GP

has been developed to provide the best translucency and a perfect match with Vita shades. The special formula incorporating patented resins provides better aesthetics, making it ideal for anterior restorations.

The product has good aesthetics, translucency without light curing, reliable bond strength to enamel and dentine, excellent physical properties, reaching 90% of its mechanical properties in ten minutes and is economical, says the company. Fuji VIII is available in either capsules or a hand mixed version.

Non-stick formula

New GC Gradia Direct Flo flowable composite can be used in conjunction with Gradia Direct and the shades can be matched to the colour concept of the easy to use, aesthetic composite.

Due to its physical properties and flow characteristics Gradia Direct Flo can be used as a liner, for blocking undercuts under composite restorations and for minimal intervention cavities.

The product's non-running and non-stick formula shapes to cavity walls and makes it easy to handle. This radiopaque material is supplied in a syringe design that allows for easy manipulation and

precise application. It is available in seven shades, A1, A2, A3, A3.5, A03, CV and BW.

The Rotor Syringe can also be used with the Astra Self-Aspirating Cartridge. This method uses the unique and effective design of the Astra Cartridge to induce aspiration. Designed to be effective and practical, the Rotor Syringe is fully autoclavable, helping dentists to maintain the highest levels of hygiene and infection control within their surgeries.

The moulded components are made

from PEEK, offering a lightweight well balanced syringe, which is easy to use. It also ensures that components will not rust after repeated exposure to autoclaving or chemicals commonly used within the dental surgery.

The Rotor Syringe is constructed from quality stainless steel, making it exceptionally comfortable to use.

One step composite polishing

The latest addition to the Shofu range includes One Gloss. It is a one-step finisher and polisher and can be used to finish

and polish all composite restorations simply by altering the contact pressure on the restoration, without having to change instrument.

One Gloss can also be used for the removal of stains or excess resin cement from tooth surfaces without damaging the enamel, which has proved to be particularly useful in orthodontic cases and polishing after scaling, thus reducing chairside time.

One Gloss is packaged in a set of 60 polishers (20 each of Cup, Midi Point and Inverted Cone shapes) and 3 x CA Mandrels plus instructions.

Consistent mixing

Dentsply's range of amalgams Dispersalloy and Megalloy EZ with ProMix amalgamator can cater to every alloy preference and technique, says the company.

ProMix provides a high degree of accuracy for more consistent mixing. The spring tensioned, moulded capsule holder enables ProMix to virtually adapt to every capsule design. The sealed mix area ensures that spills can be quickly and easily removed.

It has a sleek ergonomic design with touch pad controls and an LED display that is not only aesthetically pleasing in the office environment, but is also easy to load and unload. It also has a smooth

surface, compatible with many disinfectants.

The ProMix amalgamator with either Megalloy EZ capsules or Dispersalloy capsules can cater to your preferred technique.

For hard to reach areas

NuBend 120° is specially angled to allow injection of composite in hard to reach areas. It can be used in linguals of lower teeth, the distal of a terminal maxillary tooth and undercuts on crown preps that require coring.

With traditional ampules, instances occur where the composite injected simply pulls out when the ampule is removed. This necessitates placement of the material on an instrument and delivery to the awkward area, which causes air voids and compromised contours can result. NuBend 120° enables easier access and direct injection of the composite.

In addition, Nubend composite is a light cured, resin based microhybrid allowing superior strength and polishability. The composite has a viscosity that is easy to handle and will not slump.

Reader response number 62

Strength and beauty combined

Procera Laminate withstands the rigors of both professional handling and patient use due to a 700 MPa flexural strength. The layered NobelRondo porcelain ensures esthetic results and patient satisfaction, its makers claim.

The 0.25 mm Procera Laminate core of densely sintered aluminum oxide (alumina) is biocompatible, effectively masks underlying discoloration, and minimises staining issues during bonding. Also translucent, Procera Laminate preserves the tooth's luminescence.

Reader response number 59

Self-etching system

OptiBond All-In-One from Kerr is a single-component, self-etch adhesive that eliminates multiple steps when bonding direct and indirect restorations. The light-cured adhesive provides superior adhesion to all surfaces and substrates, even indirect metal-based restorations. Its ternary solvent system provides enhanced shelf-life stability and effective enamel etching for long-term bond performance. OptiBond All-In-One Self-Etch Adhesive delivers penetration of dentin tubules, giving you exceptional bond strength and protection against microleakage and post-op sensitivity.
