### DAVID BLAUSTEIN

THE GALLEON GROUP,  
NEW YORK, NY, USA

### ERIK DE CLERCQ

KATHOLIEKE UNIVERSITEIT  
LEUVEN, BELGIUM

### RODERICK FLOWER

WILLIAM HARVEY RESEARCH  
INSTITUTE, QMW, LONDON, UK

### F. PETER GUENGERICH

VANDERBILT UNIVERSITY  
NASHVILLE, TN, USA

### FRANZ HEFTI

MERCK RESEARCH  
LABORATORIES, SAN DIEGO,  
CA, USA

### JOAN HELLER BROWN

UNIVERSITY OF CALIFORNIA  
SAN DIEGO, CA, USA

### MADS KROGSGAARD

THOMSEN  
NOVO NORDISK, BAGSVAERD,  
DENMARK

### HUGO KUBINYI

UNIVERSITY OF HEIDELBERG,  
GERMANY

### JULIO LICINIO

UNIVERSITY OF CALIFORNIA  
LOS ANGELES, CA, USA

### CHRISTOPHER LIPINSKI

PFIZER GLOBAL RESEARCH  
AND DEVELOPMENT, GROTON,  
CT, USA

### LESLIE MEYER-LEON

IP LEGAL STRATEGIES GROUP,  
OSTERVILLE, MA, USA

### TOMI SAWYER

ARIAD PHARMACEUTICALS,  
CAMBRIDGE, MA, USA

### GEORGE SCHLICH

MATHYS & SQUIRE,  
LONDON, UK

### JANET WOODCOCK

CENTER FOR DRUG  
EVALUATION AND RESEARCH,  
WASHINGTON, MD, USA

## ANTI-INFLAMMATORIES

# Heart of the matter

Selective cyclooxygenase-2 (COX-2) inhibitors have been the subject of intensive debate since results from the controversial VIGOR clinical trial indicated a potential link between COX-2 anti-inflammatory agents and myocardial infarction. Now, reporting in *Science*, FitzGerald and colleagues suggest that a disruption in the dynamic balance that exists between the production of the prostacyclin PGI<sub>2</sub> and thromboxane A<sub>2</sub> (TxA<sub>2</sub>) in the body might explain these cardiovascular adverse effects.

Both PGI<sub>2</sub> and TxA<sub>2</sub> are synthesized from the prostaglandin precursor PGH<sub>2</sub>, which is made from arachidonic acid in a reaction catalysed by the enzyme cyclooxygenase. The synthesis of TxA<sub>2</sub> depends on the COX-1 subtype, which is found in platelets and is involved in protecting the lining of the stomach. COX-2, on the other hand, is involved in the synthesis of PGI<sub>2</sub> in endothelial cells, and mediates pain and inflammation. COX-2 inhibitors, such as rofecoxib (Vioxx) and celecoxib (Celebrex), have been successfully marketed on the basis that the main mechanism by which the non-selective, classical non-steroidal anti-inflammatory drugs (NSAIDs), such as aspirin and naproxen, cause gastrointestinal toxicity is by inhibiting COX-1. However, the publication of the VIGOR trial results in 2001 raised concerns about the safety of COX-2 inhibitors, as a significantly higher relative risk of cardiovascular toxicity was found for rofecoxib than for naproxen. But was

this outcome due to a cardioprotective effect of naproxen, owing to its inhibition of the COX-1-dependent production of TxA<sub>2</sub>, or to a cardiotoxic effect of rofecoxib, owing to enhanced TxA<sub>2</sub> levels in the absence of PGI<sub>2</sub>?

FitzGerald and coworkers used mouse models to investigate the hypothesis that PGI<sub>2</sub> might modulate the cardiovascular effects of TxA<sub>2</sub> *in vivo*. Deletion of prostacyclin receptors was shown to enhance cellular proliferation and increase platelet activation in response to vascular injury — responses that could cause thrombotic side effects. Prostacyclin-receptor-deficient mice also had raised TxA<sub>2</sub> levels after vascular injury in comparison to wild-type mice, which was indicated by increased urinary secretion of a metabolite of TxA<sub>2</sub>.

Conversely, mice in which thromboxane receptor signalling was down-regulated, either by treatment with a TxA<sub>2</sub>-receptor antagonist or by knocking out TxA<sub>2</sub> receptors, were shown to have reduced responses to vascular injury. Finally, in mice that lacked both thromboxane and prostacyclin receptors, the increase in cellular proliferation seen in the prostacyclin-receptor knockouts was eliminated, as was the platelet activation, confirming the contribution of enhanced TxA<sub>2</sub> biosynthesis to the vascular response.

The net implication is that PGI<sub>2</sub> might modulate the cardiovascular response through its influence on TxA<sub>2</sub> levels within the body. These findings could be unwelcome to the developers of Vioxx and Celebrex — Merck and Pharmacia, respectively — as they indicate that the increased risk for developing serious cardiovascular defects observed in the VIGOR trial could be a consequence of selective COX-2 inhibition. Caution should be applied in over-emphasizing the significance of these results, however, as the jury is still out on whether naproxen might have contributed a cardioprotective effect to the outcome of the VIGOR trial.

Clare Ellis
