

Editorial

In this issue of *Pediatric Research*, there appears a review article of "Cystic Fibrosis at Forty-Quo Vadis," by Drs. Davis and di Sant'Agnese. Review articles have appeared periodically within the pages of this Journal for the purpose of updating the readership in areas important to pediatric research. The intensive investigations performed in patients with cystic fibrosis are reflective of the great clinical importance of the entity. The article is timely, particularly in light of the large number of reports, sometimes conflicting, and describes animal models and putative factors relating to the disease, as well as the litany of factors in serum and secretions with diverse biologic activities.
