Supplementary Figure 4. Robustness to changes in the stimulus pattern. (A) Firing rate of a salamander ganglion cell during a standard flash sequence (upper, 20 ms flashes) and a sinusoidal variation in light intensity (lower). (B) Firing rate of two salamander ganglion cells (left, right) during a sequence of 20 ms bright flashes with constant mean light level. (C) Firing rate of a salamander ganglion cell during a standard, dark flash sequence (upper, 20 ms flashes) and a flash sequence where the mean light level remains constant (lower).
