Supplementary Figure 3 Correlation between an late / early learning ratio and late signal increase in postcentral gyrus. Signal increase from Session III to Session V correlated positively with an index of late (from Session III to Session V) versus early (from Session I to Session III) learning computed in the following way: (late – early)/(late + early). Positive values indicate stronger late learning, negative values indicate stronger early learning. Values may vary between -1 and 1. The line indicates linear regression.
