Supplementary Figure 1  Grand-averaged ERPs obtained when the uncued target was presented 70 ms before the cued target, averaged separately according to which target was reported to appear first. The ERPs shown were recorded from occipital electrodes (PO7 and PO8) and were collapsed over cue side (left, right). The onsets of the uncued target (T1) and the cued target (T2) are denoted on the time base, and the major contralateral ERP components elicited by T1 and T2 are labeled in bold red and italicized blue fonts, respectively. (a) Target on cued side reported to appear first. (b) Target on uncued side reported to appear first.
