Figure 2. Analyses of T-cell populations in SCID mice before and after splenocyte replenishment. (a) Splenocytes were analyzed for their T-cell content before being injected into SCID mice. Shown are the contents of CD3+ T cells in a normal splenocyte population (left histogram) and in a splenocyte population depleted of T cells (right histogram). (b) FACS analysis of the T-cell (CD3+) content of lymph nodes and peripheral blood of SCID mice that were replenished with a normal splenocyte population or with a population of T cell depleted splenocytes (**P < 0.01, t-test; n=5 per group).
