TWENTY YEARS ON

The discovery of the human immunodeficiency virus type 1 (HIV-1) twenty years ago has led to unprecedented advances in the science, understanding viral pathogenesis, host/virus interactions, and immune responses to infection — as well as in drug discovery and antiretroviral therapy.

As institutions engaged in conducting or funding HIV/AIDS research and prevention, we are proud to be associated with this very special issue of Nature Medicine commemorating 20 years of HIV science. As we look to the future, we are profoundly aware of the challenges that still lie ahead.
