initial and final *s* were quite lost, and the action of the mutes, *c*, *t*, was almost *nil*.

The invention is highly interesting, the effects at present produced are sometimes startling (as in cries, coughs, laughter, music), the philosophy of the process (taking a permanent impression of a very complex compound vibration, and using it as a mould to reproduce that vibration) is exceedingly attractive, but at present the instrument—at least that one which I saw, differing in many respects from the one described by Prof. Mayer—has not risen beyond a lecture illustration or a philosophical toy.

Phonetic Representation of Vowels and Diphthongs

PERHAPS your correspondent, Mr. Sedley Taylor, would kindly test with his phoneticoscope the propriety of calling the English combinations *ea*, *ae*, *oe*, *ie* diphthongs, and the simple vowel *i*, as pronounced in the personal pronoun, a simple sound. Perhaps also the English *ā* (as in "*name*") may be regarded as a diphthong. In Otto's German Grammar, the German combinations *ae*, *oe*, *ue*, are classed as modified vowels. I fancy *ee* is a diphthong, though in rapid speech it becomes more like the simple sound *ue*.

The Acoustical Properties of Soap Films.

IN connection with the interesting results recently obtained by Mr. Sedley Taylor upon the acoustic properties of soap-films, as exhibited in the simple and beautiful instrument which he has termed the Phoneticoscope, I should like to call attention to the following passage published in 1873 by Prof. E. Mach, of Prague, in his *Optisch-Akustische Versuche*:—

"Bei dieser Gelegenheit kann erwähnt werden, dass die Plateauschen Flüssigkeitshäutchen sich vorzüglich zum Studium der Membranschwingungen eignen. Eine solche Flüssigkeitshaut vor eine tönende Pfeife gebracht zeigt meist mehrere Bäuche. Ein Lichtpunkt, der sich in der Membran spiegelt, gibt mehrere glänzende geschlossene Curven."

After some remarks on the low tones to which these films vibrate, and on their vibrations to the upper partial tones, the author passes on to another subject with the remark:—"Ich erwähne diese Experimente, weil sie vielleicht, weiter verfolgt, zur Beantwortung mancher Fragen über Membranschwingungen beitragen können."

There is no mention, however, of the rotating pairs of coloured vortices noticed by Mr. Sedley Taylor. Brewster appears to have observed similar phenomena (see *Edin. Trans.*, vol. xxiv, "On Colours of Soap Bubbles," &c.) as the result of directed currents of air upon films. I have found that the vortices are also produced when a small lightly vibrating tuning-fork, having its prongs previously wetted with soap solution, is made to touch a flat soap film produced in the ordinary manner.

Cumulative Temperature

THE idea of a clock with an uncompensated pendulum for temperature integration referred to by Mr. Cooke (*NATURE*, vol. xvii. p. 323 and p. 448) has probably occurred to many persons, and was proposed by me in 1840; I found, however, that it was not new then. Forbes says in his Report on Meteorology (Brit. Assoc. Report, 1832, p. 213):—"A mechanical mode of taking the mean of an infinite number of temperatures has been proposed by M. Grassman, by observing the change of rate caused by the influence of temperature upon the uncompensated pendulum of a clock (*Poggendorff*, 1825). The idea is a good one, but was proposed long ago by Dr. Brewster ('Edinburgh Encyclopædia,' art. Atmospheric Clock)." The chief merit in this matter will belong to the person who puts the idea into a working form which can be proved capable of giving accurate results.

The Southern Drought

IN response to your question appended to my letter in the last number of *NATURE*, I am able to give you the time of the

last great drought in the Gilbert Islands. In 1870 I visited these and several other islands in the South Pacific (an account of my cruise appeared in Dr. Petermann's *Mittheilungen* for June, 1871), and at that time there was a very general drought. I was among the Gilbert Islands during October, and found that no rain had fallen there for several months. The cocoa-nut and pandanus-trees, upon which the people almost entirely depend for food, were very much dried up, and the fruit upon them were small, both in quantity and in size. This drought continued for two years after my visit, and the famine became so severe that many of the people were starved to death. Had it not been for the fish they procured, it is doubtful whether any of them would have survived, for the cocoa-nut and pandanus-trees ceased to yield fruit, and the poor people were obliged to chew the roots of the trees.

Since that time I have heard of another season during which there was little rain, in consequence of which there was comparative scarcity, but this was not to be compared with the great drought of 1870-1872.

I regret to say no long-continued observations on the rainfall have been made in Samoa. My own time was so fully occupied with other matters, during my residence there, that I neglected this one. As the droughts there have not been great enough to cause anything like distress, the periods of their occurrence have, unfortunately, not been recorded.

Research in Libraries

BEFORE this "voice from Australia" can reach London, I hope that some steps will have been taken towards carrying out Dr. Mallet's valuable suggestion (*NATURE*, vol. xvi. p. 457) so far as regards the British Museum and other leading European libraries.

The benefit of the proposed arrangement would, I am sure, be felt in Australia as much as in America. Anybody living here, in the North of Queensland, who may wish to consult a scientific book must take a sea voyage of 700 or 1,100 miles at a cost of 16*l.* or 20*l.* in money and at least a fortnight or three weeks in time. It may happen that one has a busy friend in the library city who will undertake the search through good-nature, but most people would prefer to employ a competent man who would do so as a matter of business.

Should the trustees or directors of the great libraries hesitate (and they may) to accept the responsibility of recommending searchers, probably it would answer nearly as well if the searchers were to advertise references to well-known scientific or literary men. Perhaps a hint might be taken from the Register House in Edinburgh. Titles to land in Scotland require registration for their completion. A purchaser, to satisfy himself that the seller has not previously alienated or burdened the subjects, has to overhaul the books of the register. This is done for him as a rule by professional searchers, some of whom are official and some unofficial. The system has worked admirably for some centuries I believe. Any Scotch lawyer could explain its details.

The subdivision of labour suggested by Dr. Mallet would enable a much higher use to be made of the system than the mere hunting-up of references. For example, if there were a searcher in Paris—a well-read geologist—to whom I could intrust an order for "any references in French geographical works bearing on the date of the erosion of the terrace between the Queensland coast range and the Pacific," or some such information, what possibilities would open out to the dwellers in distant isles, nay, even to the comparatively privileged inhabitants of London itself?

Mimicry in Birds

WITH reference to the correspondence on this subject which has recently appeared in *NATURE*, may I add the following instance, which has fallen under my own observation?—

On the coast of Kent is a tract of land protected from the sea by an embankment of shingle, and known as the "Reculver Marsh." It is frequented by skylarks and ring-plovers. Almost all these larks have incorporated the well-known alarm note of the plovers into their song. With such distinctness is this double note brought in, that the first time I heard it I could with difficulty convince myself that it was not uttered by *Egialitis hiaticula*.
