Creaking, at other times, as
when a sail strikes against
the mast or flaps before the
wind
Partly whizzing, partly as when
a sail flaps before the wind
As when a sail flaps before the
wind

Christiania, September 16

As when a thunder-clap passed
over us from west to east
Soft crackling, as from electric
sparks from an electrical
machine
As when stroking a cat's back
against the hairs

SOPHUS TROMHOLT

A White Swallow

DURING our walk to-day on the Kendal Road, near Heversham, my brother and I were very much surprised to see a white swallow amongst a number of the ordinary kind. The bird's plumage was entirely white, except the lower part of the breast, which was greyish.

We are quite sure of its identity, as it flew around us several times.

Can you tell us whether a white swallow is really an uncommon sight?

MARY BRIGGS

Sandside, near Milnethorpe, Westmoreland, September 4

THE HUME COLLECTION OF ASIATIC BIRDS

FOR some time past the interest of ornithologists has been aroused by the rumour that Mr. A. O. Hume, of Simla, had offered, or intended to give, his celebrated collection of Asiatic Birds to the Trustees of the British Museum; and I am glad to be able to inform the readers of NATURE that the whole of this collection is now safely housed in the Natural History Museum, the second half having been delivered by the P. and O. Company on the 18th of last month.

Those of our readers who are not ornithologists may wish to learn something in the first place about the collection itself and its generous donor.

Mr. A. O. Hume, C.B., occupied formerly a high position in the Bengal Civil Service, and devoted for many years his leisure hours to the study of ornithology, and especially of the birds of India. His aim was to form a collection of birds of every part of the British Asian Empire, in which every species should be represented by a complete series of specimens illustrating its range and its variations of colour according to age, season, or locality. For this purpose he organised a system under which a great number of local observers and collectors (in some years numbering nearly 100) worked for and with him. He fitted out expeditions with a staff of collectors and taxidermists, under his own leadership or that of his able former curator, Mr. Davison, into Scinde, Coorg, Manipur, the Malayan Peninsula, Tennasserim, and the Andaman and Nicobar Islands; he acquired by purchase or donation the Mandelli collection from Sikkim and Tibet, Brook's beautiful series from North-Western and Central India, Adam's Sambhur birds, Bingham's collections from Delhi and Tennasserim, Scully's collection from Turkestan. The expense incurred in forming this collection was in proportion to the enthusiasm with which Mr. Hume worked. He had built at Simla a museum for the reception of the collection which should finally form the basis for the preparation of a comprehensive work on the avifauna of the vast region which he was exploring. But whilst thus engaged Mr. Hume, with his wonderful activity and ready pen, which had rendered him *facile princeps* in all matters regarding Indian ornithology, published numerous papers in an ornithological periodical, *Stray Feathers*, which he founded and conducted for ten or eleven years, as well as several separate works—viz. "Notes on the Indian Raptors," "Nests and Eggs of Indian Birds," "List of the Birds of India," "Game Birds of India, Burmah, and Ceylon," and others.

However, during the last few years naturalists, to their great regret, became aware that Mr. Hume's interest in ornithology began to yield to other important matters of

social and political nature; and finally, the grievous loss by theft of an enormous mass of ornithological manuscripts, comprising his materials for "The Birds of the British Asian Empire," and the whole of his Museum Catalogue, contributed to his determination to abandon his intention of working out his collection, and to present it to some museum where others might utilise the materials he had collected.

It is very gratifying that Mr. Hume, "considering the British Museum as the one that has most claims upon him, and Mr. Sharpe as the man most capable in Europe of doing justice to the collection," offered to present it to the Trustees of that institution. The Trustees, fully aware of the scientific importance of the collection, had no hesitation in accepting the offer. Still, before actually transferring the collection, Mr. Hume was desirous of completely rearranging and placing it in thorough good order, and also of preparing at the same time a Catalogue of the Birds of the Indian Empire containing the results of his long and careful studies. Unfortunately this project could not be carried out owing to the difficulty of finding a competent coadjutor in the work, or rather of obtaining the means of properly remunerating such a person. And as there was great risk in leaving the collection without due curatorial supervision exposed to the deteriorating influences of another rainy season in India, the Trustees obtained Mr. Hume's consent to transmitting the collection without further delay to England.

Mr. Sharpe, who is always ready to sacrifice his personal comfort to duty, started for Simla almost at a moment's notice, and although, unseasoned as he was, he had to travel and work during the hottest part of the year, he seems to have infused his energy into all who had to help him in the gigantic task of packing the collection. He started on April 25, arrived in Simla on May 21, completed his work by the end of June, and returned to the Museum on August 15, having the satisfaction to find on his return the half of the collection which had preceded him safely lodged in the Museum, while the other half was delivered a week later without loss of, or damage to, any of the cases.

The collection comprises about 400 skins of mammals, 63,000 skins of birds, 300 nests, and 18,500 eggs. It was packed in eighty-two cases, the majority with a capacity of 30 cubic feet. Even to those who are used to the inspection of large collections, these figures can hardly convey a correct idea of the magnitude of this addition to the National Museum. Mr. Hume may truly say that such a collection has never been made before; and such will probably never be made again. Each specimen is enveloped in a brown paper wrapper with the name of the species and locality written on the outside, proper labels being, besides, attached to the specimen. The skins themselves are in excellent condition, and, thanks to the precautions taken by Mr. Sharpe, they are not likely to harbour or to develop destructive inmates. Specimens which had suffered from damp or insects and to which no special interest was attached, were eliminated during packing.

The scientific value of the collection, of course, is not to be measured by the number of specimens only, but by the judgment which determined their selection, by the history attached to many of them, and by the completeness of the series. We may reasonably assume that it contains about 2000 species, so that on an average each species is represented by some thirty specimens, which number in the majority of the cases would not go beyond a fair illustration of its range and variation. Therefore the number of duplicates which will be eliminated by Mr. Sharpe during the progress of the examination will probably be much smaller than one might anticipate on a superficial inspection; and I need not say that Mr. Hume's earnest wish that the series which he has brought together with so much discrimination and care should remain
