southern England and in Palestine of groups of flint implements made upon precisely the same definite and specialised plan". It seems scarcely probable that a race of people in Palestine worked out a series of this kind of flint implements on exactly the same lines and produced identically the same technique as another race living in southern England and—unless the early Pleistocene age of the Palestine implements is accepted—at a much later date. Mr. Burkitt, in discussing implements from India (see Antiquity, September 1930), compared them with implements from South and East Africa, and suggested that they were on a periphery of distribution of a single industry. Mr. Reid Moir is now strongly inclined to the view that the implements of Early Chellean type from Africa, India, and Palestine are to be referred to the same age as those in England, the early Pleistocene, and that at certain periods of past geological time stone implements were being made on the same highly specialised plan over enormous areas of the earth's surface, having started from a common centre. Hence it is not surprising to find that Mr. Reid Moir accepts the almost inevitable corollary that in the conditions governing movement, whether of culture or of race, at this early age, great periods of time must have been involved, with the implication that in most of the current computations man's antiquity is much underestimated.

Development of Weather Forecasting.

THE Quarterly Journal of the Royal Meteorological Society for July 1931 contains an interesting survey of the present position of weather forecasting, by C. K. M. Douglas. The author pays tribute to the work of J. Bjerknes and other Norwegian meteorologists, who have developed in greater detail the system of analysis of synoptic weather charts according to the past history of the different air streams begun by Shaw and Lempfert many years ago in "The Life History of Surface Air Currents". He points out that for short-period forecasting the value of the method is undoubted, especially for periods up to twelve hours ahead. Any adequate discussion, however, of practical forecasting must always take note of peculiar tendencies observed, at least in European weather, described as 'persistence of type 'and 'mood'. An excellent example of the first is mentioned, that of the severe spring snowstorms of April 2 and 11, 1917. The synoptic charts that accompanied these storms are said to have had features in common not shared by any other charts during the present century. second tendency is for rain to be absent in certain seasons when the distribution of pressure is such that in an ordinary year it would be accompanied by rain at that season.

The mere recognition of these two tendencies does not greatly help the forecaster, but does indicate a line of research that might lead to important advances. In the case of persistence of type, it may be that by using synoptic charts covering a very wide area, most cases where a particular type of pressure distribution over, say, the British Isles and the North Sea appears to return after an interruption of two or three days, there will be seen to be a distribution of pressure over a much larger area that has been persistent during the interruption, the latter appearing as a mere local disturbance.

'Mood' is less easy to explain, and very difficult to investigate with our present limited information about the upper atmosphere, if, as seems probable, it is due, as the author suggests, to long-period fluctuations of temperature and humidity in the upper atmosphere.

University and Educational Intelligence.

Cambridge.—The treasurer of the University has received a cheque for £1000 from the Worshipful Company of Goldsmiths, for the better equipment of the Metallurgical Laboratory.

Mr. J. W. A. F. Balfour-Browne has been elected to a Frank Smart studentship in zoology at Gonville

and Caius College.

At St. John's College, G. Bateson and R. O. Redman have been elected to fellowships. Mr. Bateson is an anthropological student, while Mr. Redman is assistant

director in the Solar Physics Observatory.

For the eleventh year in succession, Trinity College announces the offer of a research studentship open to graduates of other universities who propose to come to Cambridge in October next as candidates for the degree of Ph.D. The value of the studentship may be as much as £300 a year. The same College offers, as usual, dominion and colonial exhibitions to students of dominion and colonial universities who wish to come to Cambridge next October as candidates for the degree of B.A., M.Litt., M.Sc., or Ph.D. These exhibitions are of the titular value of £40; if the financial need of an exhibitioner cannot possibly be met by this amount, the Council has power, if it sees fit and if funds are available, to award him an additional payment. Candidates must apply through the principal authority of their university. Applications for the studentship and exhibitions should reach the Senior Tutor (from whom further particulars may be obtained) by July 1, 1932.

OXFORD.—Dr. Herbert H. E. Craster, fellow of All Souls College, has been elected by the curators of the Bodleian Library, to be Bodley's Librarian, subject to the approval of Convocation on Nov. 3.

APPLICATIONS are invited by the Grocers Company, Grocers Hall, E.C. 2, for research scholarships in sanitary science, each of the annual value of £300, plus an allowance for expenses. The necessary form of application and information respecting the scholarships are obtainable from the clerk to the company.

The Council of the Institution of Naval Architects has made the following awards: Vickers Armstrong scholarship in naval architecture (1931) to Mr. Leonard Redshaw, of Messrs. Vickers-Armstrongs, Ltd., Barrowin-Furness—the scholarship is of the value of £150 per annum and will be held at the University of Liverpool for three years; and the Duke of Northumberland prize (in connexion with the 1931 examinations for national higher certificates in naval architecture) to Mr. James Irwin, of the Royal Technical College, Glasgow.

Birthdays and Research Centres.

Oct. 31, 1872.—Sir John Russell, O.B.E., F.R.S., Director of the Rothamsted Experimental Station, Harpenden.

My work—indeed, my whole life—is so intimately bound up with Rothamsted and my colleagues there that I find it difficult to disentangle myself from them. Our general purpose is to see how far science can go in solving the problems of country life. The most fundamental problems are those associated with crop production: the management of the soil, the nutrition of the plant, the ways of dealing with destructive insects, fungi, and other pests, and the ways of utilising
