

presence of two silver isotopes. For aluminium the decay period is  $9.5 \pm 0.5$  min. and for copper about 7 min. The observed radiations in each case are of electronic mass and for silver and aluminium are electrons. Estimates have been made of the activity induced by a given number of neutrons and of the energy of the radiation emitted. CHARLES HAIG: The spectral sensibility of *Avena*. The bases and tips of young oat shoots respectively were exposed to monochromatic light. The tip responses show a maximum at  $\lambda$  4800; base responses show no maximum in the visible spectrum but possibly one in the ultra-violet. This confirms the earlier suggestion of separate photo-receptor systems. FOLKE SKOOG and KENNETH V. THIMANN: Further experiments on the inhibition of the development of lateral buds by growth hormone. The view that this inhibition is due to high concentration of growth hormone preventing its production by a given tissue is re-stated. Inhibition is complete without increase in stem length or thickness. Further, crystalline preparations of growth substance are as effective for decapitated pea plants as natural preparations of the same concentration of growth substance, showing that impurities are not involved. ALFRED J. MARIA: The potential of a positive mass and the weight function of Wiener. NATHAN KAPLAN:  $V_3$  in  $R_6$ .
