

abundance of inoculum produced during this season on cotton and other plants.

Verrall³ also identified the fungi associated with stain in green lumber treated with Lignasan and with Dovicide P. He found no special staining flora on the treated wood, and no evidence of a build-up of stains resistant to the treating chemicals. Some stain was obtained on most treated pieces of pine lumber under the severe conditions of the tests. *Endoconidiophora coerulescens* is probably the most important staining fungus on hardwoods, and treatments were less effective against this fungus than against other species. However, no difficulty was experienced in getting hardwood lumber to remain stain-free after treatment. *Graphium rigidum* and *Ceratostomella pluriannulata* were isolated in relatively greater numbers from Lignasan-treated than from Dovicide-treated wood. *Diplodia natalensis* was not isolated from treated wood. The greater part of the occasional severe staining of treated wood is attributed to poor handling practice, not to failure of the treatments themselves.
