

Another selective reagent, toluene-3:4-dithiol, is found to give a green complex with rhenium (and also with molybdenum) and a blue one with tungsten (Miller, *Analyst*, 69, 112; 1944). The *K*-absorption limit for rhenium is reported to be 172.66 by Manescu (*C.R. Acad. Sci.*, 216, 732; 1943) who examined its salts between 'Cellophane' sheets using a potential of 100–125 kV.

According to Naray-Szabo, rhenium trioxide crystals are cubic (*Naturw.*, 31, 466; 1943).
