Following the outbreak of the First World War in 1914, Prof. Batho became research officer to the Canadian Machine Gun Corps and, later, served as senior technical assistant at the Royal Aircraft Establishment, Farnborough. After spending a short time as lecturer at Trinity College, Cambridge, he returned to McGill University in 1919 as associate professor of applied mechanics and hydraulics. In 1924 he was appointed to the chair of civil engineering in the University of Birmingham, where he remained until his retirement in 1950.

Prof. Batho was responsible for a considerable amount of research dealing with reinforced concrete and various aspects of structural engineering, his main interest being in statically indeterminate structures and in riveted and other connexions. He was chairman of the Midland Association of Civil Engineers during 1932–34 and a member of the Steel Structures Research Committee from 1929 until 1936.

A bachelor and of a retiring disposition, Prof. Batho was a man of wide cultural interests. His devotion to music and the arts led him, in the years gone by, to pay numerous visits to Continental centres.

Prof. Giovanni Giorgi

On August 19 of last year the scientific world suffered a great loss by the accidental death, through drowning, of Prof. Giovanni Giorgi, of the University of Rome, widely known as the proposer and champion of the M.K.S. system of electrical units which bears his name.

Prof. Giorgi was born at Lucca on November 27, 1871, took his degree in engineering at Rome in 1893

and immediately devoted himself to the study of theoretical physics and mechanics. He explained his scheme of units in 1901 in a paper published in Atti della Associazione Elettrotecnica Italiana, and submitted three years later to the St. Louis Congress of the International Electrotechnical Commission. The Giorgi system was officially adopted by the Commission in 1935: it is an extension of the practical system (amperes, volts, henries, farads, etc.) to include electric and magnetic fields. In Giorgi's words, "this will result in a great simplification of all practical calculations and of the learning of electrical theory in the schools. A great deal of waste of time and intellectual fatigue will be saved."

In 1903 Prof. Giorgi published an important paper on methods of studying and representing sinusoidal alternating currents, and he followed this by several papers on electrical transients. He gave a precise theoretical basis to Heaviside's operational

calculus.

Giorgi was the author of more than three hundred and fifty papers on physical and mathematical subjects. All his writings are characterized by clarity of ideas, simplicity of exposition and elegance of expression.

WE regret to announce the following deaths:

Dr. E. E. Day, formerly president of Cornell University, a distinguished economist and statistician, on March 23, aged sixty-seven.

Mr. G. E. Pearson, formerly chairman and governing director of the Wellcome Foundation, Ltd., on March 29, aged eighty-two.

NEWS and VIEWS

Mathematics at the Queen's University, Belfast: Prof. T. G. Room, F.R.S.

PROF. T. G. ROOM, of the University of Sydney, who has been appointed to the chair of pure mathematics at the Queen's University, Belfast, was educated at Alleyn's School and at St. John's College, Cambridge. He held an assistant lectureship in mathematics at the University of Liverpool during 1925-29, and was elected to a fellowship at St. John's College, Cambridge, in 1927. From 1929 he was a University lecturer in mathematics at Cambridge, until he was appointed to the chair of mathematics at Sydney in 1935. At Cambridge his geometrical powers developed under the guidance of Prof. H. F. Baker, and he soon began to make important contributions to the subject. Attracted by the synthetic methods of Reye, and interested in the incidence properties of geometrical configurations, he set out to discover generalizations, in higher space, of theorems such as that of the double-six of lines in the solid, and of the set of five associated lines in a four-In this connexion he was naturally led to investigate the properties of projectively generated manifolds in higher space. In 1939 he published a classical treatise on the "Geometry of Determinantal Loci", giving a systematic account of the subject, of basic importance for further advances. The projective properties of these loci are established by a powerful use of synthetic methods, together with simple matrix algebra. This branch of geometry is by no means exhausted, and Prof. Room is still extending our knowledge in this field. Prof. Room was elected to the Royal Society in 1941.

Civil Engineering at Melbourne: Dr. A. J. Francis

Dr. A. J. Francis, who has been appointed to the chair of civil engineering in the University of Melbourne, is a graduate of the University of Birmingham, having taken a first-class honours degree in civil engineering in 1934 and afterwards the M.Sc. and Ph.D. degrees of that University. After graduation, Dr. Francis was appointed assistant engineer to the Worcestershire County Council and later joined the staff of John Mowlem and Co. During the last years of the Second World War he served with the Ministry of Home Security and the Admiralty. At the conclusion of the War he was appointed a lecturer in the Department of Civil Engineering in the University of Birmingham, a position which he held until his appointment to the Melbourne chair this Dr. Francis has specialized in structural research and has published a number of papers on the structural analysis of reinforced concrete, steel and light-alloy structures. He is married, with three sons, and takes a keen practical interest in music.

Physics Subdivision of the Atomic Energy Project, Canada: Dr. B. W. Sargent, M.B.E.

Dr. B. W. Sargent has been appointed assistant director in charge of the Physics Subdivision of the Atomic Energy Project, Chalk River, Canada, in succession to Dr. W. H. Watson, who last year was appointed head of the Physics Department, University of Toronto. Dr. Sargent has been associated with the Atomic Energy Project since its inception, and in 1945 worked on the heavy-water reactor pile, the first to be built in Canada. Since then, he has been
