current issue of *Industrial Archaeology*, Dr A. Buchanan, the director of the centre, says he has adequate records for only three counties—Hertfordshire, Somerset and Staffordshire.

Many monuments have been preserved. The New Lanark industrial estate, which incorporates the technology of Arkwright with the social planning of Robert Owen, and Coalbrookdale, where Abraham Darby first successfully smelted iron ore with coke, are obvious and famous examples. But these are exceptional and the list of industrial monuments which have been destroyed is depressingly large and growing steadily. As things are, the relics of the transport revolution, canals, turn-pike roads and railways, with their magnificent bridges, are more than ever threatened.

Oxford on Iron Rations

from our Oxford Correspondent

THIS week the governing bodies of British universities will be examining the details of their Quinquennial Grants from the University Grants Committee, but few of them, perhaps, with as little delight as Oxford. Yet at first sight, Oxford's grant seems generous. In 1965-66, of Oxford's total income of £8.0 million, the UGC provided £5.25 million, with a further million pounds of government money coming from research councils and other public bodies. By comparison, the recurrent grants for the next five years are:

1967-68	1968-69	1969-70	1970-71	1971-72
£6.1 m.	£6.2 m.	£6.4 m.	£6.6 m.	£6.8 m.

Equipment is to be provided for separately from these grants.

In fact, the increase in the grant since 1966 will do little more than cover increases in salaries and prices during the period so that, according to the Hebdomadal Council, there will be no additional funds available for new expenditure next year. At the same time, universities are having to repay sums to the Grants Committee in compensation for the increase in their incomes from the higher fees of overseas students. Oxford, however, refused to increase these fees, so that £63,000 will have to be paid from the university's own funds, with none of the income for which it would have been a compensation. These payments are expected to increase over the five years.

Even if the Quinquennial Grant had been less parsimonious, the devaluation of the pound would doubtless have forced economies on most university faculties, especially on the science side. Ironically, devaluation will harm those university departments the growth of which the committee had hoped to encourage by increased allocations. The Bodleian Library, for example, has long been short of funds; in 1963-64 its total income was only \$1.75 million (at the old rate) compared with nearly \$6 million for Harvard University Library. The Quinquennial Grant contains provisions for increasing library expenditure by 20 per cent per student. How far this will be vitiated by devaluation and the increased cost of some books, it is too early to say. In the same way, the growth of Middle Eastern and Latin American studies will be slowed down and these departments, as well as the science faculties, will be waiting earnestly to hear that the government will compensate for the fall in the value of the pound.

There is therefore little hope that Oxford will be able to expand its activities, even though it receives public money from a variety of sources. Increasing college fees—paid for in the main by local authorities—is no light matter and, even if tuition fees are increased, colleges will be able only to appoint a few new tutors to help out penurious university departments. Even so, the majority of college tutors depend in part on university emoluments, paid for by the UGC. Finally, whatever elasticity of this kind there may be in arts faculties, there is far less in science, where the expense falls almost entirely on the Grants Committee and the various research councils. These latter will shortly be issuing their own estimates; if they are equally disappointing, then Oxford will indeed have to live on rather sparser fare than might have been hoped.

Money for Harvard

HARVARD UNIVERSITY is trying to raise nearly \$50 million for an ambitious (some might say, luxurious) programme to make science more exciting for undergraduates at Harvard College. Of the total sum, \$14.5 million will be used to build a new science centre, with laboratories, computers and a library, in which undergraduates will be encouraged to do research. Their efforts to do this now are inhibited by the demands of graduate and post-doctoral research. Another \$12.6 million has been budgeted for a new centre for research and teaching in biochemistry and molecular biology (fields in which Harvard has four Nobel Laureates). A project is also indicated to endow five professorships, in astronomy, biology, engineering, mathematics and physics.

More than one fourth of the several thousand undergraduates at Harvard take degrees in science. The others, who read humanities or social sciences, must spend at least a small fraction of their time at Harvard studying science or the history of science. They, as well as the science undergraduates, will benefit from "a programme for science" as it is being called. Harvard says that it is conscious of its responsibility to give all of its students, especially those who will become teachers, some acquaintance with what modern science is about.

Physics Directory

THE ninth edition of the *Directory of Physics and Astronomy Faculties* has been published by the American Association of Physics Teachers and the American Institute of Physics for the period 1967-68 (\$3). The purpose of the directory is to list those universities in America, Mexico and Canada which offer physics courses and the members of staff who teach these courses. The information which has been collected is part of the procedure used to improve coverage of the National Register of Scientific and Technical Personnel which is maintained by the American Institute of Physics under the sponsorship of the National Science Foundation.

Also listed this year are departments of astronomy and astrophysics, but this section is incomplete and it is hoped that better coverage will be given next year. The directory is divided into seven parts: part one provides a geographical listing of personnel and institu-
