

## CORRIGENDUM

### Molecular genetic features of myelodysplastic syndromes (MDS)

CL Willman

*Leukemia* 1998; **12** (Suppl. 1): S2–S6

In the above paper line 10, paragraph 3, column 1 on page S3 should read:

Interestingly, deletion of one IRF-1 allele in MDS AML was usually **not** accompanied by the rearrangement or deletion of the residual allele.

and line 1, paragraph 1, column 2 on page S4 should read:

For instance, expression of the oncogene *bcl-2*, which blocks apoptosis, is increased in AML cells and is associated with increased survival of leukemia cells *in vitro* and poor prognoses.
