Owing to a publishing error, Figure 3 (parts A and B) in the above paper were reproduced incorrectly. The correct complete Figure 3 is shown below.

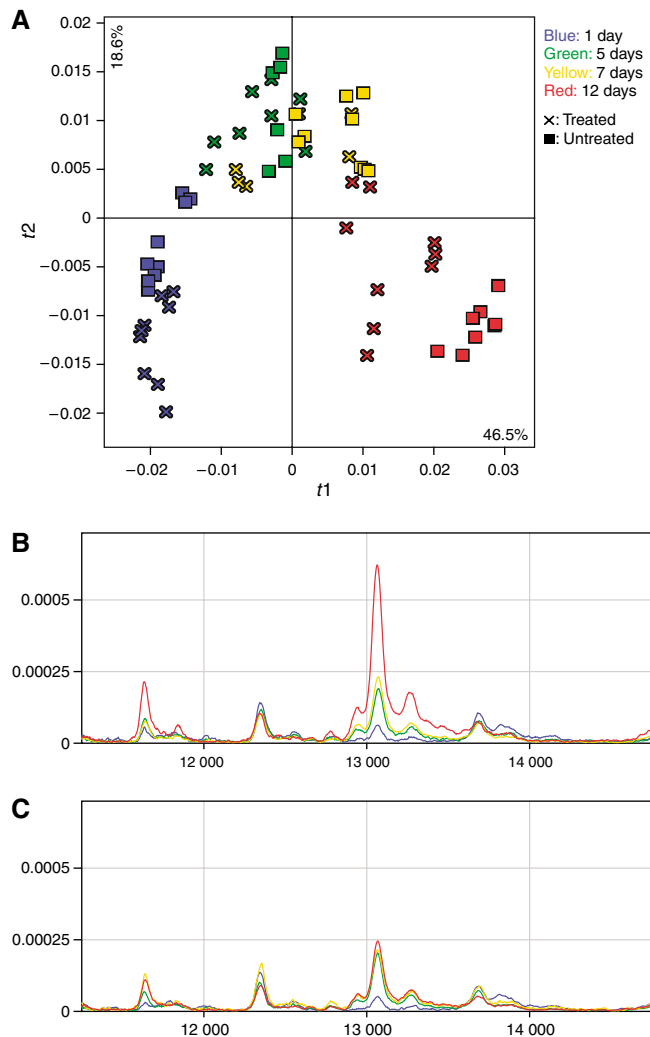

Figure 3 Principal component analysis reveals a time trend in protein expression during tumour progression (**A**). $R^2X(\text{cum})=0.65$ for the first two components. 'x' and '■' represent treated and untreated samples, respectively, and the different colours represent samples collected at different time points after treatment, as follows: blue = 1 day; green = 5 days; yellow = 7 days; red = 12 days. (**B**) and (**C**) display mean protein profiles within a specific spectral region, derived from untreated and treated samples, respectively. The samples are from the same time points as above and the same colour coding is applied.
