Key Topics in Ophthalmology (2nd ed)

Eye (2003) 17, 287

doi:10.1038/sj.eye.6700275

Key Topics in Ophthalmology (second edition) is a revised and updated version of the initial text 'Key Topics in Ophthalmology'. The book is aimed at ophthalmologists in training and aims to provide a useful adjunct to established textbooks. Working in an alphabetical manner each topic is

presented in a standard problem-oriented format. It starts with an introduction and a brief background of the problem. This is followed by description of clinical features, treatment, complications and conclusions. A very useful and brief list of references ends each section. Photographs and diagrams have been excluded in this edition. The book thus provides a concise and up-to-date knowledge of the common problems encountered by

trainee ophthalmologists in examinations and would therefore act as a very useful means of rapid revision. It could also act as a quick reference guide for a trainee ophthalmologist working in a busy casualty department.
