

## INDEX OF SUBJECTS

- Adh* polymorphism in Olive fruit fly, 169–185  
  in the seaweed fly, 45–55  
  system in barley, 187–195
- Afghanistan, peas from, showing strain specificity for rhizobium, 203–210
- altered salivary amylase gene, 127–135
- ammoacid dye, effects of, in *Drosophila*, 325
- antagonistic pleiotrophy and components of fitness, 63–78
- antibody genes, 326
- apomixis, partial, and sex ratio, 107–116
- assortative mating with dominance, 145–146
- asymmetry and diversity in finger ridge counts, 393–405
- bats, Australian, genetic differences between species, 435–438
- B-chromosome polymorphism in rye, 345–369
- biallelic model, maintenance of females for, 329–343
- bias in estimates of viabilities, 271–282
- biochemistry of nucleic acids (book on), 311
- chromosomal distribution of repetitive sequences in wheat, 371–376
- cloned genes, stability of in yeast, 323
- competitive ability in ryegrass, 421–434  
  selection in *Cepaea*, 407–419
- co-ordinate induction by androgens, 323
- cultural transmission and evolution (book on), 441–442
- cyanogenic glucoside production in clover, 324–325
- Darwinian impacts (book on), 152–153
- deletion mutations, use of, in *Aspergillus*, 322
- directional selection in *Drosophila*, 27–33
- dispersal, measurement of, in *Podosma*, 237–249
- distribution of self-incompatibility alleles, 299–303
- DNA amount in Hyacinth pollen grain, 251–261
- dynamics of B-chromosome polymorphism in rye, 345–369
- enzyme heterozygosity in plaice, 117–125
- enzymic and chromosomal polymorphisms, 35–44
- estimating outcrossing rate in plant populations, 283–292
- estimation of viabilities, 271–282
- evolution of *Drosophila* in Hawaii, 3–25
- expression of mouse  $\alpha$ -amylase genes, 325–326
- finger ridge counts, analysis of asymmetry in, 393–405
- gametophytic incompatibility system, 377–381
- gene dosage effects in *Coprinus*, 324  
  transfer into mouse germ-line, 322–323
- genes involved in nitrate assimilation in *Aspergillus*, 321
- genetic basis of development, (book on), 313  
  control of pairing in rye, 57–62  
  rRNA in flax, 211–226
- differences between sibling species of bats, 435–438
- organisation in *E. coli*, 321
- population structure in ants, 95–106
- variability, short-term directional selection on, 27–33
- variation, 63–78  
    in the seaweed fly, 45–55
- genetics of finger ridge counts, 393–405
- higher plants (book on), 151–152
- polygynous ants, 95–106
- genotype frequencies, change of, under full selfing, 139–144  
  in incompatible systems, 377–381
- globin genes, structure and expression of, 325
- H-2 gene products, functional aspects of, 326
- Hawaiian *Drosophila* project, 3–25
- histidine dicarboxylase gene complex in the mouse, 322
- human chromosomes (book on), 315–316
- induced quantitative variation in *Nicotiana*, 79–83
- inversions, sex-linked, in Blackflies, 85–93
- island populations (book on), 318–319

- mapping of storage protein genes in peas, 383-392
- meiotic pairing in rye, genetic control of, 57-62
- microbial evolution, aspects of, (book on), 317-318
- model, one-locus, for effects of partial apomixis, 107-116  
 system choice of, for investigating competitive selection, 418-419
- morphological variance and enzyme heterozygosity, 117-125
- movable genetic elements (book on), 316-317
- mutational analysis of *Adh* system in barley, 187-195
- nodulation-resistant variants of *Pisum sativum*, 197-201
- nucleotype and genotype in pollen development, 251-261
- outcrossing frequency in *Senecio*, 227-235
- pea: rhizobium interactions, 203-210
- plant populations, selection in, 329-343
- pleiotropy, dominance and genetic variation, 63-78
- pollen grain development in Hyacinth and Scilla, 251-261
- polygony in Formica ants, 95-106
- polymorphism for outcrossing frequency in *Senecio*, 227-235  
 in seaweed fly, 35-44, 45-55
- polytypic species of grasshoppers, 147-150
- population genetics in bees, 263-270  
 substructuring and outcrossing rate, 283-292
- quantitative variation, analysis of, 79-83
- random mating in closed populations, 263-270
- recombinant inbred lines of *Nicotiana*, 79-83
- repetitive DNA selection from hexaploid wheat, 371-376
- resistance to 5 fluorindole in *Coprinus*, 324
- ribosomal RNA in flax, 211-226
- Salivary amylase gene in a mouse strain, 127-135
- selection and partial apomixis, 107-116  
 competitive in *Cepaea*, 407-419  
 directional on genetic variability, 27-33  
 in plant populations of infinite size, 329-343  
 of *Adh* in *Dacus*, 169-185
- self-incompatibility alleles in plants, 299-303  
 in *Nemesia*, 137-138  
 -pollinated population, change of genotype frequencies in, 139-144
- sequential development in *Drosophila*, control of, 326
- sex determination in bees, 263-270  
 in grasshoppers, 147-150  
 linked inversions in Blackflies, 85-93
- storage protein genes in peas, inheritance of, 383-392
- strain specificity for *Rhizobium* in peas, 197-201, 203-210
- translocations in the house mouse, 305-309
- wheat haploids, preferential survival of, 293-298
