Mitowheel, visualizing the human mitochondrial DNA

Gábor Zsurka¹, Attila Csordás²

Problem: non-intuitive, visually poor database queries in mitochondrial genomics

Solution: The circular, human mitochondrial DNA (16569 bp) molecule is represented with a wheel and by spinning this wheel users can quickly scan through, browse and identify the particular regions of interest.

Features: versatile search functions (position, sequence, nucleotides, mutations, genes, regions, GenBank seqs), allele frequencies, copy sequences to clipboard

Team/Technology: Gábor Zsurka (concept, programming, graphics), Attila Csordás (ideas, testing)/ Flash Professional 8/Actionscript
