Abstract

- Novel methodologies are currently being evaluated for the Chemical Analysis of soybean seeds as well as developing and mature soybean embryos by FT-IR/NIR Microspectroscopy.
 - This is the first report of FT-NIR Chemical Images obtained with 1 micron resolution. NIR spectra of Proteins, Oil and DNA fibers are obtained for regions as small as $1\mu^2$.
-

Instruments and Samples

- Four commercial IR/NIR instruments available in 2002 from PerkinElmer Co. (Shelton, CT, USA) were employed in this study:
 - FT- NIR Spectrometer (*SpectrumOne-NTS*)
 - FT- IR Spectrometer (*SpectrumOne*)
 - FT-NIR Microscope (*NIR AutoImage*)
 - FT-IR Microscope (*Spotlight300*)
 - Intact Soybean seeds, soybean Embryos, and standard test samples were investigated in the spectral range from 11,000 to 700 cm^{-1} , with spectral resolutions to 0.5 cm^{-1} . Chemical Images were obtained both in the Reflection and Transmission Mode in as little as 3 minutes (at 8 cm^{-1} resolution). The best microscope resolution of ~1 micron was obtained with the NIR AutoImage Microscope coupled to the SpectrumOne-NTS spectrometer.
-

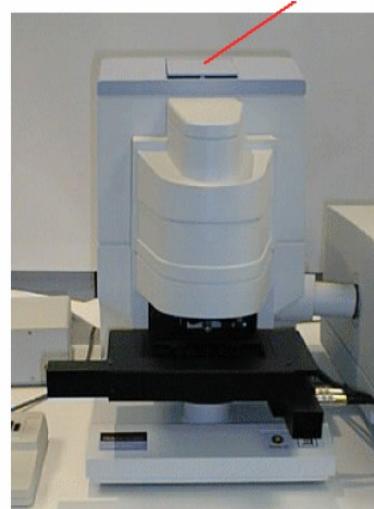

FT-IR Spectrometer *Spectrum One* and FT-NIR Spectrometer *SpectrumOne-NTS*

- Introduced in 2001 by Perkin Elmer Co. (Shelton, CT, USA) for High Sensitivity, high-resolution and long-term Stability
 - Spectrum One and Spectrum One NTS have a similar look but are configured for different spectral ranges.
 - Both instruments were employed for our IR /NIR Micro-spectroscopy and Chemical Imaging investigations of Soybean seeds and Embryos.
-

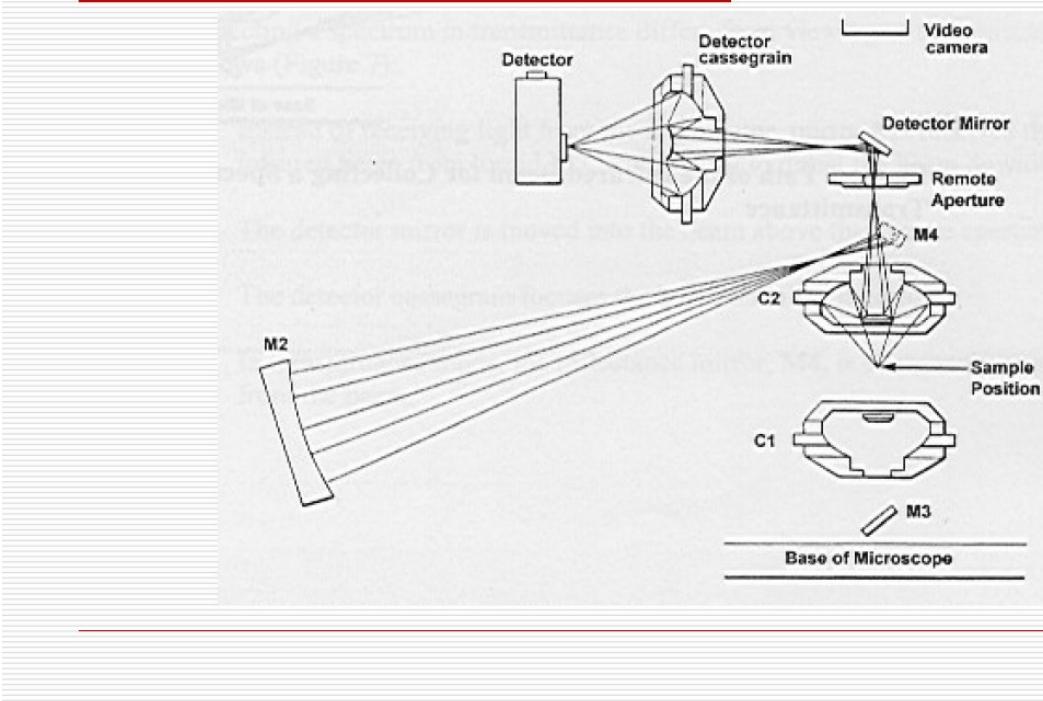

FT-NIR Microscope: *NIR AutoImage*

- Introduced in 2002 by PerkinElmer Co. (Shelton, CT, USA) for high-resolution studies
- Employed for our NIR Microspectroscopy and Chemical Imaging investigations of Soybean seeds and Embryos

AutoImage NIR Microscope Simplified Diagram for Operation in the Reflection Mode

FT-IR Microscope: *Spotlight300*

- Introduced in 2002 by PerkinElmer Co. (Shelton, CT, USA) for high-resolution studies
 - Employed for our Mid-IR Microspectroscopy and Chemical Imaging investigations of thin sections of Soybean seeds and Embryos

Conclusions

- Novel-design instrumentation for FT-IR/NIR Chemical Mapping, Microspectroscopy, and Fluorescence Microscopy is now capable of automated visualization of composition distribution and developmental changes in Single Soybean Seeds and Somatic Embryos with precision close to the *picogram* range. This may allow us to speed up the Genetic Selection of Soybean lines with Improved Oil or Protein, and Sugar composition.
 - High-resolution NIR Chemical Imaging may also enable rapid and sensitive analyses with micro-arrays for nucleic acids, multiple molecular bioassays, and automated proteomics that can help develop new Biotechnology, Biomedical & Pharmaceutical applications (ref. 2), such as those aimed at Cancer Prevention and its early Detection.
 - Detailed nutritional studies in Cell cultures with phytochemicals, such as Soy Isoflavones (ref. 1), are now also made possible by FT-NIR Chemical Imaging of Single Cells either in culture or *in vivo*.
