

VP as an educational tool. Respondents were asked to rate their agreement with each statement on a 1 to 4 likert scale.

**Results:** All participants (N=25) completed the questionnaire. 100% of participants agreed or strongly agreed that the case was enjoyable, interactive and appropriate for their level of training and a valuable use of their time. Upon completion of the case, most participants reported greater self confidence in their ability to recognize (23/25) and report (24/25) cases of suspected child abuse. All participants felt that the VP helped raise their awareness of the difficulties surrounding the diagnosis and management of child abuse and enabled them to identify deficits in their knowledge.

**Conclusion:** There was an overwhelmingly positive response to the VP. The vast majority of participants reported improvements in their knowledge, confidence and attitude towards the management of child abuse.

#### INDIRECT COSTS CAUSED BY ACUTE ROTAVIRUS GASTROENTERITIS IN SPAIN

F. Martinon-Torres<sup>1</sup>, M. Bouzon Alejandro<sup>2</sup>, L. Redondo-Collazo<sup>2</sup>, J. Sanchez-Lastres<sup>3</sup>, J.M. Martinon-Sanchez<sup>2</sup>, ROTACOST Investigators Group from ReGALIP (Galician Pediatric Research Network - [www.regalip.com](http://www.regalip.com))

<sup>1</sup>Hospital Clinico Universitario de Santiago, <sup>2</sup>Pediatrics, Hospital Clinico Universitario de Santiago, Santiago de Compostela, <sup>3</sup>Pediatrics, Centro de Salud de Chapela, Vigo, Spain

**Background and aims:** Impact of rotavirus in developed countries is mainly economic. The aim of this study was to assess the indirect costs induced by rotavirus acute gastroenteritis (RAGE) in Spain.

**Methods:** A prospective observational study was conducted from Oct-2008-to-Jun-2009 including 682 children up to 5 years-old with AGE attended in primary care (n=18), and emergency-room and hospital settings (n=10), covering the regions of Galicia and Asturias (North-West Spain). All non-medical expenses incurred were recorded in detail using personal interviews and telephone contacts.

**Results:** Of 682 enrolled children, 207(30.4%) were rotavirus positive and 152(22%) had received at least one dose of rotavirus vaccine. The mean (standard deviation) indirect cost caused by an

episode of AGE was estimated at 135.17(182.70) euros. Costs were 1.7-fold higher when acute gastroenteritis was caused by rotavirus as compared to other etiologies: 192.7(219.8)euros vs.111.6(163.5)euros ( $p < .001$ ).The costs for absenteeism were the most substantial with an average of 91.41(134.76)euros per family, resulting from the loss of 2.45(3.17) days of work. In RAGE group the cost was 120.4(154)euros compared to 75.8(123) of the other etiologies( $p = .002$ ), due to the loss of 3.5(3.6) vs1.9(2.9)days of work( $p < .001$ ).Meals costs were 2-fold-higher in RAGE: 48.5(55) vs 24.3(46)euros[ $p < .001$ ]. Travel costs were 2.6-fold-higher in RAGE:32(92)vs12.5(21.1) euros [ $p = .005$ ]. There were no differences between groups regarding hiring of caregivers or purchase of material costs. Patients with RAGE were admitted to hospital more frequently (47.8%vs14%)[ $p < .001$ ].

**Conclusions:** Rotavirus generates a significant indirect economic burden that should be considered in the economic evaluation of the eventual inclusion of rotavirus vaccine in the spanish immunization schedule.

#### INHALED NITRIC OXIDE AFTER OXIDATIVE STRESS IN NEWBORN RATS. EFFECTS ON VEGF EXPRESSION AND ALVEOLARIZATION

M.J. Hernández-Bejarano<sup>1</sup>, L. San Feliciano<sup>1</sup>, A. Remesal<sup>1</sup>, M.D. Ludeña<sup>2</sup>

<sup>1</sup>Department of Pediatrics / University of Salamanca, <sup>2</sup>Cellular Biology and Pathology / University of Salamanca, Salamanca, Spain

**Background and aims:** Exposure of newborn rats to hyperoxia decreases VEGF expression and impairs alveolarization. Much evidence indicates that NO plays a role in VEGF signaling and recent studies have shown that NO induces VEGF synthesis. The purpose of this study was to determine whether inhaled NO improves VEGF expression in the lung tissue and alveolarization after neonatal exposure to oxidative stress.

**Methods:** Newborn rats were randomized to breathe room air (A), 2 hours A + NO (20 ppm) , 2 hours hypoxia + 2 hours hyperoxia (HH), HH + NO, 2 hours hypoxia + air (HA) or HA + NO. We evaluated pulmonary VEGF in rats at 14 days of life by immunohistochemistry using 1:100 dilution of rabbit anti-human VEGF (sc-152, Santa Cruz). We used a semiquantitative assessment of VEGF
