

KEEP DENTAL UNIT WATERLINES CONTINUOUSLY CLEAN

Planmeca x BWT Clean Water Systems is the result of a collaboration between two internationally renowned brands, bringing together Planmeca's dental care technology and BWT's [Best Water Technology's] water treatment expertise. The aim of the partnership is to provide optimal and reliable water treatment solutions for dental clinics around the world. The solutions are designed for clinics of all sizes and ensure that clean water is always available for dental units and autoclaves.

Clean water is essential in a clinic environment: it supports the safety of the clinic staff and helps to ensure a risk-free treatment environment for patients. Clean water is also needed to keep dental units, autoclaves, instruments, and other dental equipment functioning properly.

The Planmeca x BWT Clean Water Systems product range includes water treatment solutions for different needs and different clinic environments.

For individual dental units, the product range offers Planmeca Patrol by BWT, a dental unit integrated water filtration system that doesn't require any external filters. The system removes

unwanted particles from the water entering the unit, prevents limescale formation, adjusts water hardness and improves the smell and taste of the water. Filtered water will help keep dental units and instruments functioning properly, preventing unexpected service calls and downtime.

The product range also includes water filtration systems for individual autoclaves and for clinics with multiple dental units and autoclaves, as well as water disinfection solutions for clinics and dental schools. The disinfection solutions bring significant time and cost savings to larger clinic environments, since they keep dental unit waterlines continuously clean without the need for separate waterline cleaning.

ENVIRONMENTALLY FRIENDLY INTERDENTAL TOOL

Friendly Floss from **reuseus** is a reusable flossing tool that is friendly for teeth and for the planet. The founders of the company were inspired to help reduce plastic waste partly through seeing David Attenborough's 'Blue Planet II' which highlighted the impact on albatross chicks from ingesting small plastic picks.

Friendly Floss has the following benefits:

- It replaces single use floss picks – improving our environmental impact
- It can be used with any brand of floss – preferably biodegradable
- It can be threaded in a way that works for you – four techniques are suggested on the Friendly Floss website with short video instructions using just 20–40 cm of floss
- It is possible to control the tension of the floss – tight through contact points, loose to hug your teeth into gums, and
- It is designed for purpose – with a softened shape to protect your gums, angled arm slots to prevent release during use, and a central horn providing offsetting forces
- You can access all teeth – small size (8 cm length) and pencil style handle makes Friendly Floss easy to fit in mouth, manoeuvre and reach all teeth
- The floss can be rotated during use which is helpful as biodegradable floss can fray
- Clean and reuse – beautifully crafted food grade stainless steel

with no moving parts; simple, attractive and incredibly durable and easy to clean in a dishwasher or sink for use again and again

- Sustainable packaging – Friendly Floss' packaging is made from a single piece of recyclable kraft card that folds in on itself for delivery and display, and breaks back down for disposal to help reduce environmental impact.

The creators of Friendly Floss are confident that once you have perfected threading your floss, you will have a better flossing experience every day, and improve your environmental impact. Friendly Floss: a bit more time for a lot less impact.
