the mechanics, what can be improved and awareness of the treatment options.

The diagnostic tests or structured clinical reasoning (unseen cases) are often the part trainees are most concerned about. Examiners are looking to see if candidates can provide an accurate diagnosis and a workable plan, not an answer to every question. It is important to read the case booklet carefully, and look vigilantly at the photographs, study models and radiographs. One examiner asks about the diagnosis aspect, whilst the other about a treatment plan (7.5 minutes each). Trainees should demonstrate an understanding of treatment mechanics, awareness of the limitations of a specialist and when multidisciplinary care is required. They should aim to provide a preferred and alternative plan and be able to justify decisions with reference to current research. Preparation is key, so aiming to seek advice from as many supervisors as possible is essential.

In Edinburgh candidates sit an oral examination (general viva) consisting of six different topics, whereas in London candidates sit the OSCE. Most topics in the structured general viva are shown by a picture, where quick definitions and answers are required. Edinburgh includes a separate station for communication with an actor which lasts for ten minutes. Scenarios range from explaining a type of treatment to offering advice to a parent. The London OSCE consists of 16 stations including communication skills, interpretation of diagnostic material, practical skills and decision making in clinical situations. Stations vary from written, communication (four stations) and practical, including wire bending or tracing and interpreting a

trainees to keep updated with any changes, so they can tailor their own learning needs and be fully prepared to succeed. This article gives an overview of the current examination formats for supervisors to best prepare orthodontic trainees. It is vital to be aware of recent changes to the Edinburgh RCS MOrth format with regard to part A: two written two-hour papers (instead of a single three-hour paper) and part B: a shortened presented case template. In 2020, the bicollegiate London and Glasgow exam will be taken online in a changed format with changes to the Edinburgh exam also.

The authors would like to acknowledge the RCS examiners for their contribution to this article.

Dentists added to PPE portal

The Department of Health and Social Care (DHSC) has now added dentists and orthodontists in England to the list of primary and social care providers able to order and receive 'emergency' supplies of critical coronavirus PPE through a government portal. The portal will enable dentists to order and receive emergency supplies of Type IIR masks, aprons, gloves, visors and hand hygiene free of charge. Weekly order limits will be calculated based on a practice's number of UDAs and UOAs per year.

The portal is intended solely as an 'emergency top-up system' and dentists should continue to use their existing business-as-usual and wholesaler supplier routes to access PPE.

In Scotland, supplies of PPE are being provided by NHS National Services Scotland. Deliveries are being made to Health Boards across Scotland for onward distribution to all dental practices.

The British Dental Industry Association (BDIA) is concerned with this government intervention in the commercial supply chain when there is currently no PPE 'emergency' and is involved in continuing discussions with the office of the Chief Dental Officers and senior DHSC officials regarding the ongoing provision of PPE supplies to dental practices and will remain in close contact in relation to the operation of the portal.

BDA Eastern Counties Branch AGM – Online

Wednesday 30 September 2020
19:00–20:30

Please ensure you register your interest in attending at www.bda.org/bse in order to receive the link to access the AGM or email branchsectionevents@bda.org.
