

Next level immediacy

As part of its comprehensive ImmediaXy suite of solutions, Straumann takes immediacy to the next level. It offers an ecosystem of solutions designed to facilitate efficient and confident immediate temporisation for single units, multiple teeth or full-arch cases.

This includes:

- 3Shape Trios intraoral scanner for accurate data capture
- Straumann DiagnostiX and Straumann Cares Visual Chairside software for streamlined surgical and prosthetic planning
- Straumann BLX implant with innovative SLActive surface for high primary stability and predictability of immediate loading protocols

- Straumann Cares C Series for chairside milling of temporary restorations.

Straumann has been a leader in the global dental implant market for several years now, having established a reputation for cutting-edge solutions backed by science.

Its ImmediaXy solutions are a must for any practitioner looking to optimise predictability, flexibility and longevity of their immediate implant treatments.

For more information about the Straumann ImmediaXy suite of solutions, visit www.straumann.com.

All-in-one and all-round protection

Last year Dentsply Sirona launched its new DAC Universal with a modern look and numerous changes based on the needs of the customers, eg Touch-Display, LAN interface, guided Check & Clean. This year the new DAC Universal S is ready to take things even further. The beneficial features of the DAC Universal are continued in the DAC Universal S and now supplemented with a complete sterilisation function – especially for markets that require sterilisation instead of a disinfection of unwrapped medical devices.

With two programmes to choose from the automatic programme selection of the DAC Universal S continues to provide maximum process reliability: the Pink Lid Program is specially designed for rotating instruments

such as turbines, straight and contra-angle handpieces. The reprocessing process starts with a cold pre-wash. After an internal cleaning of the spray and gear channels a fully automatic lubrication follows. External cleaning with the pulse-wash method removes dirt and deposits from the outer surfaces of the instruments. The cleaning performance is excellent: the results far exceed the standard values (80% better) required by the Robert Koch-Institute. Finally, instruments are sterilised at 134°C with three minutes holding time, and then cooled with cold air. The second programme, the White Lid Program, is used for instruments that do not require lubrication: eg ultrasonic handpieces and tips or nozzles of multifunctional syringes and powder jet devices as well as powder jet handpieces. The cleaning steps are almost

identical to the Pink Lid Program, but with lubrication step removed.

The DAC Universal S uses only demineralised water for all cleaning and sterilisation steps, and does not require chemical cleaning agents, therefore preserving the lifespan of instruments. The guided maintenance workflow Check & Clean and the LAN interface for electronic documentation systems are also integrated into the DAC Universal S.

The complete process takes approximately 21 minutes for each programme – a fully compliant hygiene cycle with just a press of a single button.
