

Products to support periodontal therapy

The effective management and treatment of periodontal diseases is an essential part of patient care for many dental professionals. Whether treating periodontitis or peri-implantitis, it is important to understand the disease aetiology and to have protocols in place to arrest its development and restore the patient to health.

Professor Moritz Kebschull, Professor of Restorative Dentistry at the University of Birmingham, shared some of his extensive expertise on the matter at the recent British Dental Conference & Dentistry Show (BDCDS) in May, sponsored by Curaprox. Given how widespread the issue of periodontal disease is – affecting patients of all ages, backgrounds and needs – it is essential that professionals have the knowledge, tools and confidence to ensure early detection and intervention. Despite there being a fairly significant amount of literature in the field, Moritz urged colleagues to assess the relevance and quality of research they use to formulate their protocols in practice.

The literature can be categorised into three groups – high quality evidence, moderate and low quality. The strength of the research should be considered when applying it to practice: high quality papers give recommendations, moderate papers offer suggestions and low-quality research covers topics to be considered or combined with one's experience and common sense. That's why the Clinical Practice Guidelines from the European Federation of Periodontology (EFP) for the treatment of stage I–III, as well as stage IV periodontitis and peri-implantitis are so useful. They utilise the latest, highest quality research to provide unbiased advice for clinicians.

As Moritz pointed out in his session, periodontal disease never goes away – it is a lifelong condition that must be managed by the patient and the professional team. Systemic risk factors such as lifestyle and oral hygiene routine must be reviewed and acted upon frequently to maintain periodontal long-term health. For clinicians, subgingival instrumentation is important to debride root surfaces with minimal damage to the soft or hard tissue. This can be combined with non-surgical therapy adjunctive measures, and care should be taken to prioritise these and then surgical interventions before moving onto antibiotics. Moritz went so far as to suggest how a supportive periodontal therapy appointment may be delivered by dental hygienists/therapists, involving 15 minutes for examination and diagnosis, ten minutes for re-motivation of the patient regarding oral hygiene instruction, 20 minutes on instrumentation, 7/5 minutes on subgingival instrumentation or re-infected areas and 7.5 minutes on polish and review.

Ultimately, the new periodontal treatment guidelines promote four simple steps applicable to all levels of case complexity, including restoration of defects following arrest of active disease. Those who attended Moritz' session at BDCDS certainly left with plenty of food for thought. Given the ongoing challenges of maintaining periodontal health – in patients with or without implants – this will remain an important topic for all members of the dental team for years to come.

Fluoride varnish in patient-pleasing flavours

Exclusively available from Trycare, Centrix's FluoroDose is the award winning 5% sodium fluoride varnish that's easy to apply in less than a minute.

To make your life easier, Centrix's redesigned FluoroDose packaging has new patented features to enhance its handling, comfort and patient safety. In addition to a single dose of varnish, each LolliTray contains a Benda Brush applicator and has been designed so that it can be 'popped up' with one hand, making removal simple and safe.

FluoroDose has a smooth consistency, fast application and choice of five patient-pleasing flavours – caramel, bubble gum, mint, cherry and melon. It is supplied in an Introductory Pack containing all five flavours and refills of individual flavours.

Because the varnish is freshly mixed prior to application it always has the optimum fluoride distribution, unlike syringes which frequently separate out leaving inconsistent mixes of ineffectively low and dangerously high fluoride concentrations. Each LolliTray contains enough varnish to protect a full adult dentition. Non-gritty and easy to apply in an undetectably thin film, it is colourless so that it does not affect the appearance after bleaching etc.

Quick-drying and long-lasting, FluoroDose is suitable for adults with caries risk factors as well as children. It can be applied as often as needed and is FDA-approved for treating dental sensitivity.

For further information about the complete Centrix range contact your local Trycare representative, call 01274 885544 or visit www.trycare.co.uk.
