

Author Correction: Efficient electrical detection of mid-infrared graphene plasmons at room temperature

Qiushi Guo , Renwen Yu , Cheng Li, Shaofan Yuan, Bingchen Deng, F. Javier García de Abajo  and Fengnian Xia 

Correction to: *Nature Materials* <https://doi.org/10.1038/s41563-018-0157-7>, published online 27 August 2018.

In the version of this Article originally published, the units of the right-hand *y* axis of Fig. 2a were incorrectly labelled as mS; they should have been μ S. Also, the *x*-axis tick marks of Fig. 3b should have been aligned with Fig. 3a,c. These have now been corrected.

Retraction Note: Large local lattice expansion in graphene adlayers grown on copper

Chaoyu Chen , José Avila, Hakim Arezki, Van Luan Nguyen, Jiahong Shen, Marcin Mucha-Kruczyński, Fei Yao, Mohamed Boutchich, Yue Chen, Young Hee Lee  and Maria C. Asensio

Retraction of: *Nature Materials* <https://doi.org/10.1038/s41563-018-0053-1>, published online 9 April 2018.

The authors unanimously wish to retract this Article due to their concerns about the interpretation of the low-energy electron microscopy (LEEM) and diffraction (LEED) patterns reported in the manuscript. In this study, the authors used spatial and angle-resolved photoemission spectroscopy (ARPES) to characterize graphene monolayers grown on copper foils, and observed regions of graphene adlayers with enhanced graphene/Cu interaction, higher Dirac cone doping level, moiré mini Dirac cones and large lattice expansion. All these properties have been clearly verified and reproduced by photoemission spectroscopy as well as explained by density functional theory. LEEM and LEED characterization were also carried out to confirm the existence of a moiré superlattice and lattice expansion, and the results were included in the main manuscript and Supplementary Information. On further analysis of the LEEM/LEED data, it seems that while the existence of a moiré superlattice can be corroborated, the conclusion of graphene lattice expansion (7%) based on spatially resolved ARPES determinations cannot be confirmed by the LEEM/LEED measurements. The authors realized that these measurements were collected from statistically non-representative areas of the sample. Moreover, the fact that the raw microLEED images bear an asymmetry factor of as much as 5% due to the instrumental aberration makes it impossible to estimate any compression or expansion of the same order. Consequently, their conclusion on the graphene lattice expansion can only be supported by the photoemission data. In view that more complete and reliable structural determinations should be conducted, all authors wish to retract this Article.
