Author Correction: Optimization of Magneto-thermally Controlled Release Kinetics by Tuning of Magnetoliposome Composition and Structure

Behzad Shirmardi Shaghasemi, Mudassar Mumtaz Virk & Erik Reimhult

Correction to: *Scientific Reports* <https://doi.org/10.1038/s41598-017-06980-9>, published online 07 August 2017

The Supporting Information file that accompanies this Article contains errors in SI-7, ‘The average mass of single SPION and number of SPION in Magnetoliposomes’,

$$\text{“core mass of single SPION} = 5.024 \frac{\text{g}}{10^{21} \text{nm}^3} \times 31.059 \text{ nm}^3 = 1.627 \times 10^{-19} \text{ g} \text{”}$$

$$\text{Shell mass} = \frac{34}{66} \text{ total mass of single SPION}$$

$$\text{Shell mass} = \frac{34}{66} \times 1.56 \times 10^{-19} \text{ g} = 8.384 \times 10^{-20} \text{ g}$$

$$\text{single SPION mass} = 1.56 \times 10^{-19} \text{ g} + 0.8036 \times 10^{-19} \text{ g} = 2.465 \times 10^{-19} \text{ g} \text{”}$$

should read:

$$\text{“core mass of single SPION} = 5.024 \frac{\text{g}}{10^{21} \text{nm}^3} \times 31.059 \text{ nm}^3 = 1.560 \times 10^{-19} \text{ g} \text{”}$$

$$\text{Shell mass} = \frac{34}{66} \text{ core mass of single SPION}$$

$$\text{Shell mass} = \frac{34}{66} \times 1.56 \times 10^{-19} \text{ g} = 8.036 \times 10^{-20} \text{ g}$$

$$\text{single SPION mass} = 1.56 \times 10^{-19} \text{ g} + 0.8036 \times 10^{-19} \text{ g} = 2.364 \times 10^{-19} \text{ g} \text{”}$$
