Correction to: *Scientific Reports* <https://doi.org/10.1038/s41598-018-23504-1>, published online 27 March 2018

The original version of this Article contained errors in Figure 5.

In Figure 5, the image for the TPPU/NeuN panel was inadvertently duplicated for the sham condition. Therefore, the images presented for the sham/NeuN and sham/merge panels were incorrect. In addition, the sham brain included in Figure 5 was not representative, as it had a lower number of NeuN positive cells than the other brains.

The original Figure 5 and accompanying legend appears below.

The original Article has been corrected.

Published online: 14 December 2021

Figure 5. TPPU decreases peri-infarct neuronal cell death. Neuronal cell death in the ipsilateral cortex at 2 d after surgery was detected by terminal deoxynucleotidyl transferase dUTP nick end labeling (TUNEL, green) and NeuN (red) double staining. Scale bar = 50 μ m. Sham, MCAO with vehicle, and MCAO with TPPU groups were compared by ANOVA and the Holm-Sidak procedure for multiple comparisons (means $\pm$ SD; n = 5 rats per group; ** p < 0.01 vs. sham group, ++ p < 0.01 vs. vehicle group).
