Cities should respond to the biodiversity extinction crisis

Cathy Oke^{1,2,3}✉, Sarah A. Bekessy⁴, Niki Frantzeskaki⁵, Judy Bush⁶, James A. Fitzsimons^{7,8}, Georgia E. Garrard⁴, Maree Grenfell⁹, Lee Harrison³, Martin Hartigan^{7,9}, David Callow³, Bernie Cotter² and Steve Gawler²

Cities globally are greening their urban fabric, but to contribute positively to the biodiversity extinction crisis, local governments must explicitly target actions for biodiversity. We apply the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) framework — nature for nature, society and culture — to elevate local governments' efforts in the lead up to the 2021 UN Biodiversity Conference. The UN's Vision of Living in Harmony with Nature can only be realised if cities are recognised and resourced for their roles in biodiversity protection — for nature, for society and for culture.

npj Urban Sustainability (2021)1:11; <https://doi.org/10.1038/s42949-020-00010-w>

INTRODUCTION

Following the release of the *Global Assessment Report on Biodiversity* by the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES)¹, awareness of the biodiversity extinction crisis has heightened, catalysing calls for cities and nations to respond. Mass global protests, including youth climate strikes and Extinction Rebellion, and crises such as the Australian bushfires are increasingly engaging local and sub-national governments with these issues. In responses to date, more than 1700 jurisdictions from around the world have declared a climate emergency, many linking their actions on climate change to biodiversity.

The 15th meeting of the Conference of the Parties to the Convention on Biological Diversity (CBD COP 15), with a theme of 'Ecological Civilization: Building a Shared Future for All Life on Earth', will be held in Kunming, China in 2021. At this gathering, the Post-2020 Global Biodiversity Framework to safeguard nature and its contributions to human well-being will be determined by national governments. This is a vital opportunity to address the extinction crisis alongside the climate emergency, as well as embedding cities' previous and ongoing roles in these global efforts for nature restoration. 'Nature' is understood here as biodiversity (species, habitats and ecosystems) that is native to the region, consistent with the CBD and IPBES. Although non-native species, which are common in cities, can provide important ecosystem services and other benefits, native species (including threatened species) are typically more diverse and abundant in native habitats².

Nature-based solutions are systemic solutions that employ nature's ability to regulate, restore, and regenerate resources. There is increasing evidence of the efficacy of nature-based solutions for addressing complex urban challenges such as urbanisation and climate change³. Accordingly, cities are increasingly investing in a broad array of nature-based solutions as adaptation and mitigation measures. Recently, the city of Rotterdam announced an investment of €233 million in a Green Metamorphosis — a city-wide regeneration program for public squares and open spaces towards a diverse network of nature-based solutions that will replace impermeable surfaces,

contributing to biodiversity and civic amenity⁴. The CitiesWithNature platform (<https://citieswithnature.org/>) hosts cities with dedicated strategies on biodiversity and nature-based solutions to share knowledge and create a global community of pioneering local and subnational governments. For example, the cities of Montreal and Melbourne have incorporated biodiversity actions into strategic plans. The city of Edmonton has an extensive network of biodiversity corridors across the city and its periphery. Yet, while these mounting actions show a shift towards biodiversity action at the local scale, for cities to effectively respond to the extinction crisis, nature-based solutions need to explicitly address and deliver on biodiversity conservation.

Our perspective paper aims to provide strategic direction for addressing the extinction crisis in cities to urban planners, designers, policy makers and researchers. We utilise the IPBES conceptual framework⁵ that positions three dimensions of nature — 'nature for nature', 'nature for society' and 'nature for culture' — to propose a suite of opportunities for effective nature-based solutions to benefit biodiversity. In the following sections, we discuss how urban nature addresses these dimensions and identify priorities for action. We argue that cities' roles in responding to the extinction crisis should be explicitly acknowledged and coordinated, and targeted actions identified to amplify their effectiveness locally and globally. We propose solutions that could form the foundations for a bolder progressive agenda for discussion at the CBD COP 15.

NATURE FOR NATURE

The IPBES framework recognises nature's intrinsic value, 'nature for nature'⁵. Cities around the world host numerous species and ecological communities⁶, and can be hotspots for threatened species⁷, yet urbanisation processes continue to threaten biodiversity. Cities are particularly important for some species as they can provide stable, year-round resources due to plant selection and watering regimes⁸. Research is identifying important links between people's everyday experiences of nature, their connectedness with nature and their commitment to pro-biodiversity practices⁹. Priorities for nature for nature actions should include:

¹Connected Cities Lab, The University of Melbourne, Melbourne, VIC 3010, Australia. ²ICLEI - Local Governments for Sustainability, Oceania, L8 225 Bourke Street, Melbourne, Victoria 3000, Australia. ³City of Melbourne, GPO Box 1603, Melbourne 3001, Australia. ⁴ICON Science, School of Global, Urban and Social Studies, RMIT University, GPO Box 2476, Melbourne 3001 for ICON, Australia. ⁵Centre for Urban Transitions, Swinburne University of Technology, Hawthorn, Australia. ⁶Faculty of Architecture, Building and Planning, The University of Melbourne, Melbourne, VIC 3010, Australia. ⁷The Nature Conservancy, Suite 2-01, 60 Leicester Street, Carlton, VIC 3053, Australia. ⁸School of Life and Environmental Sciences, Deakin University, Melbourne, Australia. ⁹Resilient Melbourne, GPO Box 1603, Melbourne 3001, Australia. ✉email: cathy.oke@unimelb.edu.au

Recognise and implement city-level obligations and responsibilities to biodiversity

With 193 Parties, the CBD has near-universal participation among countries. Cities, and the governments that govern them, have important roles in ensuring obligations of the Convention are met within the footprint of urban areas, as recognised at COP10: Plan of Action on Subnational Governments, Cities and Other Local Authorities for Biodiversity (UNEP/CBD/COP/DEC/10/22). It is critical that the CBD continues to engage with city-focused efforts such as the Singapore Cities Biodiversity Index and the Edinburgh Process for Subnational and Local Governments on the development of the Post 2020 global biodiversity framework¹⁰. It is important that CBD and cities explicitly acknowledge these roles and responsibilities when valuing nature and incorporating 'nature-for-nature' principles in strategies, planning and implementation.

Guide biodiversity objectives in urban planning using systematic approaches

A major obstacle to achieving 'nature for nature' is a lack of systematic approaches to setting objectives, identifying actions and implementing plans that contribute to biodiversity. Biodiversity conservation is often an ad hoc co-benefit of other actions, rather than an explicit strategic priority that is systematically planned across the whole city. With a few notable exceptions, e.g. Montreal and Melbourne, most cities have only recently begun incorporating biodiversity into strategic planning and urban agendas¹¹. We propose that systematic approaches are needed to complement and re-formulate decision-making tools. Design-driven approaches for enriching nature-for-nature functions and spaces in cities, such as biodiversity-sensitive urban design¹², need to be scaled up.

Promote novel ecosystems as climate solutions in cities

Cities can be hostile environments for native vegetation because urban environments are typically highly modified. Climate change amplifies many of these effects, and adds to the planning complexity, since biodiversity conservation objectives may be undermined by, or conflict with, objectives such as cooling and shading¹³. We propose a shift from relying on historic models for restoring ecosystems, towards applying nature conservation goals to novel ecosystems that are adaptive to climate change¹⁴. For this, we need to create mechanisms and communicate ecological designs that adjust and reconceptualise urban nature for evolving climates. An example from Melbourne Australia is the addition of native mistletoes (that provide habitat for insects and birds) to exotic trees that provide shading and cooling¹⁵.

Confront and address human–nature conflicts in cities

The increased contact of people with nature in cities can pose new challenges for urban administrators. In some situations, urban biodiversity is viewed as unpleasant, dangerous or destructive¹⁶. We propose an approach to human–biodiversity conflicts that combines design and communication. Careful design to reduce potential conflict should examine services and disservices, and catalogue effective solutions to conflicts, some of which may also be tied to patterns of inequality¹⁷. An open dialogue and learning-focused approach about the benefits of nature, which also addresses conflicts and fears of nature, may increase nature literacy, decrease injustice in cities and manage conflicts.

NATURE FOR SOCIETY

'Nature for society' represents the utilitarian values of nature⁵. Nature-based solutions including green roofs, wetlands, daylighted water bodies, sustainable urban drainage systems and more, improve climate resilience, air and water quality and reduce

flooding³. In embedding nature-based solutions in programs for climate resilience, a wide range of other sustainability challenges need to be addressed, including alleviation of poverty, hunger, provision of health, education, clean water, economic growth, sustainable cities and climate action (Sustainable Development Goals 1,2,3,4,6,8,11,13). Direct economic benefits flow from employment opportunities and green jobs, and indirect economic benefits are associated with energy savings and health care cost reductions. Many of the benefits of urban nature arise from interaction with structurally complex and biodiverse green space. For example, emerging evidence suggests that human health and well-being benefits may be enhanced by incorporating biodiverse nature in cities^{18,19}. Structural and species diversity can improve the robustness of nature-based solutions in the face of threats from extreme weather, and disease and insect predation. In the face of accelerating urbanisation and climate challenges, nature-based solutions are increasingly important for resilient cities. In the current COVID-19 pandemic, urban parks and protected areas have become a lifeline for physical and mental health²⁰. Priorities for nature for society actions should include:

Creating resilient landscape systems

For nature-based solutions to effectively deliver 'nature-for-society', they need to function as healthy and resilient ecosystems. We propose a systems approach to the design of nature-based solutions that requires their integration within the wider urban infrastructure systems²¹. This involves starting with the nature-based solutions as the systemic 'seeds' of solutions in the urban design processes, rather than as 'add-ons' if space and budget allows.

Mainstream resilience principles in the design and management of nature-based solutions

Urban resilience and climate change actions can be increased through the inclusion of nature-based solutions¹³. We propose that cities mainstream resilience principles as a guiding framework for designing and maintaining nature-based solutions as urban climate infrastructure. This requires strengthening the institutional role of urban resilience teams and the commitment to long-term targets for climate change.

Adopt experimentation and transdisciplinary research to strengthen and extend expertise

Testing and evaluating new designs of nature-based solutions across diverse urban typologies, together with their financing models and policy mechanisms, is critical. Experiments, including those that can be 'safe to fail'²², are vital to creating and trialling new approaches to nature-based solutions, and to adapting to changing urban conditions. Experimentation should be based on co-production across practitioner and academic communities to ensure relevance, rigour and replicability.

NATURE FOR CULTURE

'Nature for culture' acknowledges the importance of people's connections with nature, and the benefits of social cohesion, community connection, educational, and spiritual benefits^{5,6}. Nature can provide the space in which urban communities reconnect with 'place'; establish a sense of belonging that enables social cohesion, health and well-being²³. Different types of knowledge need to be brought together to co-produce socio-ecologically robust nature-based solutions. 'Nature for culture' acknowledges the importance of diverse knowledges, including First Nations and Traditional Owners²⁴. Including diverse voices means that people and communities across different sectors, locations and demographics are invited and facilitated to contribute. This encourages the voices less heard, and less

represented to ensure a just nature for culture. Priorities for nature for culture actions should include:

Co-produce knowledge with Indigenous peoples for bringing nature in cities

Indigenous knowledge differs from western scientific knowledge systems with different time horizons, axiology, complexity and conceptualisations. Prioritising and documenting Indigenous practices supports learning-focused urban experiments with Indigenous communities and may encourage increased stewardship and nature appreciation. Working in partnership with Traditional Owners and Indigenous knowledge systems requires cultural sensitivity and ability to respectfully generate actionable knowledge for planning cities with nature.

Use place-based nature to foster inclusivity in multicultural cities
Cultural meanings and narratives of nature are part of strategic visions and policy objectives, as well as of education and communication programs. We propose culture to be the medium to bridge, connect, empower and represent diversity. This allows for nature to be a catalyst for inclusivity in multicultural cities. This can be realised by representing cultural meanings of nature in city festivals, ceremonies and educational programs for ecosystem literacy²⁵.

Reconnect people with nature in cities through citizen science and engagement programs

Urban systems and lifestyles often lead to a sense of disconnection from nature⁹. This sense of nature disconnection may be reinforced by limited access to nearby nature in parks and gardens, and increasing time spent indoors, at work, or commuting to and from work. Citizen science can be a way to examine nature's place in cities, as can other engagement programs such as Wildlife Gardening²⁶ and place-based environmental education²⁷.

CONCLUSIONS

Cities will play an increasingly significant role in global biodiversity conservation, as stewards of substantial biodiversity values and as sites for engaging the majority of the world's population in conservation issues. Cities can often be fragmented in jurisdiction and governance, but strategically planning for and restoring nature across the entire city extent can increase the benefits to nature and people in urban landscapes²⁸. Provision of adequate funding and skills for both establishing and maintaining nature-based solutions is required. Ensuring cities have access to the necessary ecological and landscape skills is key (particularly as many urban systems are 'novel' ecosystems), but so too is the social licence to be courageous about targeted, concerted action.

City leaders must meet this urgency with prioritised and budgeted action, with the added challenge of addressing the complexity of nature itself. Solutions can be found in improving the design of nature-based solutions to address the multiple dimensions of nature for nature, society and culture', with stewardship of urban nature translating into citizens assuming the role of custodians for biodiversity.

The 15th Conference of the Parties to the Convention for Biological Diversity in 2021 presents a crucial opportunity — and imperative — to strengthen and embed cities' roles in biodiversity conservation. We have identified priorities for action: to bolster nature for nature, to strengthen nature for society and to integrate nature for culture.

A transformational approach to urban nature futures, that responds to the extinction and climate change crises, should seek to maximise the achievement of all three dimensions. This requires an organisational shift to reduce professional and political obstacles and to align local objectives more closely with national and international goals. Documentation of cities' efforts in

research and practice will be needed, noting that evidence-based local and international policy should be developed through universities, practitioners and Traditional Owners sharing knowledge across contexts, continents and disciplines. This creates opportunities for diverse urban nature-voices to co-create the case for biodiversity, and can be supported through the many existing local networks, as well as the global city networks and platforms, such as CitiesWithNature. At COP 15, CBD Parties should extend the Plan of Action on Subnational Governments, Cities and Other Local Authorities for Biodiversity from 2021 to 2030 and beyond, and the Global Biodiversity Summit of Local and Subnational Governments²⁸ would do well to be highlighted at COP 15. Cities have a responsibility to act urgently to achieve this vision, and should be recognised and resourced for the role they need to play in biodiversity protection — for nature, for society and for culture.
