

Reply to 'Letter to the Editor' from Dr J. J. Wyndaele from Dr Dudognon

A copy of this letter was sent to the Senior Author, Dr P. Dudognon who replied:

'Effectively, the intention of the authors was to point out the need for a complete neurological examination including the perianal region and clinical studies of vesico-sphincter function after spinal cord injury even if no sensory and motor deficits are present as is sometimes the case with conus medullary lesions.'
