

ORAL SCANNING AHEAD OF ITS TIME

3M ESPE is proud to announce that the Lava Chairside Oral Scanner, launched in 2009, has now completed a milestone 100,000 cases worldwide, demonstrated through the Lava Case Manager software.

This milestone demonstrates credibility and high customer satisfaction in this proven system, which will be further heightened by announcements in the near future, with reduced scanning time, on-screen prep-height indicators, and screen shots which can be added to your patient's notes.

The Lava Chairside Oral Scanner (COS) from 3M ESPE features 3D-in-Motion technology. Unlike current point-and-click technology, 3D-in-Motion allows the Lava COS to capture *continuous* real-time 3D video images that create a digital impression, sent directly to your laboratory, which is then used to produce precise-fitting restorations. Lava COS is an open system, and is indicated for zirconia crowns, bridges, inlays, onlays, veneers and implant abutments with the Biomet 3i Encode system, and with a full digital workflow available (millable full contour crowns and CAD/CAM veneers).

FUNCTIONALLY UNIQUE SOFTWARE

DMP has launched a new software application, DMPRAM: 'Dental Maintenance Plan Recruitment, Assessment and Monitoring'.

The system allows you to observe and assess your patients' current oral and dental condition to establish the appropriate grade and fee for a plan. It lets you monitor the fee grade *versus* related income. DMPRAM also allows you to carry out even more admin on your computer.

DMPRAM is linked to the DMP secure web portal which offers access to the practice's payment plans database as well as many documents which can be downloaded and printed off for patient enrolment and information. You can easily download your latest monthly financial report on plan patient activity together with reports from the previous eight months. This functionally unique system is used through a secure route ensuring absolute privacy.

A NEW LEVEL OF CLEANING POWER

The Hydrosonic Electric Brush is the latest innovation from Curaprox and provides amazing results on the teeth, gums, tongue and mucous membranes.

Curaprox have developed a brush head that uses the advantages of sonic technology combined with CUREN technology. The bristles do not absorb water and are extremely soft yet firm and densely packed, heightening their spring force for an optimal hydrodynamic effect.

Extremely powerful with a long life lithium-ion battery, the Hydrosonic has three cleaning modules: intensive, soft and massage.

Featuring a two-minute timer and a jaw quadrant timer, the Hydrosonic pauses after each 30-second period so that patients move on to the next area for cleaning.

An ergonomically designed handle ensures the brush is held at a 45° angle for thorough cleaning, even in between the teeth. It is ideal for most patients, including those with implants or braces.

The Hydrosonic is available with a complete oral care set, including interproximal brushes, Enzyca and two replacement brush heads. Professional trial units are available from £35.
