

Light-curing characterisation material

FinalTouch is a light-curing composite for individual shade characterisation of direct and indirect composite restorations and masking of dental hard tissue discolorations. It is applied underneath/between the layers of composite/ORMOCER restorative materials. FinalTouch, which is available in five colours, can be used to reproduce individual features such as fissures or white spots with a natural appearance and thus create perfect restorations down to the finest detail. The accentuation of cusps and ridges, reproduction of translucent enamel areas and opalescent regions, the highlighting of the dentine core, and the reproduction of discolorations around the neck of the tooth as well as enamel cracks are also possible with FinalTouch. This makes FinalTouch the perfect complement to VOCO's top composites such as GrandioSO, Amaris and Admira Fusion.

FinalTouch can be inserted when placing

the restoration or afterwards, once the material is already completely polymerised. This also means that FinalTouch can be used chairside as well as labside. The fine material structure and homogeneous consistency allow optimal handling. At the same time, FinalTouch boasts a comparatively high layer thickness tolerance, which is a maximum of 0.3 mm for 'brown' and 0.5 mm for all other shades. As FinalTouch is supplied in the non-dripping NDT syringe with fine cannulae (type 45), it can be applied particularly precisely. Alternatively, FinalTouch can also be applied with a brush, a fine probe or a thin root canal instrument. Nuances of individual colours can be achieved by mixing them with each other or with a translucent flow composite. The curing time of FinalTouch is just 20 seconds, making it particularly suitable for chairside applications. Following curing, it is covered with a layer of restorative composite with a thickness adjusted to the individual requirements.

The best cement in its category

Providing dentists with an innovative solution for dental operations that involve permanent cementation, Kerr presents the self-etching/self-adhesive composite cement Maxcem Elite Chroma that achieves complete polymerisation in both self-polymerisation and photopolymerisation. It offers excellent adhesion and is compatible with all kinds of substrates and indirect restorations: ceramics for anterior and posterior sectors, CAD/CAM materials and metal-based restorations.

A solution that is versatile, reliable and durable, Maxcem Elite Chroma cement is a real revolution in dentistry. Its practical use is fast and easy due to the automixing syringe that – along with intraoral and endodontic tips – makes the application of the material very simple, and the innovative colour indicator gives the dentist a signal for the best time to remove the excess cement. Incomplete removal of the excess may cause unfortunate incidents of crown decementation or harm to the gums, which can occur because of either premature or late removal.

When applied, the cement takes on a temporary pink color when being extruded,

and then gradually returns to its permanent coloration during polymerisation. Simple removal in a single pass is guaranteed by Kerr's One-Peel technology, while dual polymerisation ensures the greatest flexibility in every kind of restoration.

Maxcem Elite Chroma is a new addition to the Kerr line of cements and features these notable technical properties: adhesion: it is the best in its category, and this is vital to the quality and durability of restorations; compatibility to all substrates; 280% radiopacity; and easy storage: it is not necessary to keep it refrigerated.

Gloves that won't irritate or dehydrate

Are you looking for expertly designed gloves for everyday use? Then look no further than Wrights, the exclusive distributor of Unigloves.

Working together in partnership with one of the leading manufacturers of single-use gloves, Wrights' catalogue now includes all of Unigloves' products – including the new Vitality Soft range, which feature a Lano-E coating to reduce skin irritation and dehydration.

Other products available at competitive prices include:

- Vitality Latex – 100% latex, powder free, unscented gloves

- Vitality Scented Latex – 100% latex, powder free gloves scented with citrus and peppermint
- Vitality Nitrile – latex free gloves.

But it's not just top quality consumables that are available at Wrights; the helpful and professional team offer a dedicated service to ensure that your customer experience is smooth from start to finish.

To request a sample or to find out more about the ranges available, contact Wrights now on 0800 66 88 99 or visit the easy to navigate website at www.wright-cottrell.co.uk.
