

Seasonal dental products and services

Important note to readers

This content has been created for the entertainment of readers in the spirit of seasonal good humour and, on the whole, possesses not an ounce of truth. All persons, products, URLs and email addresses mentioned have been invented by the *BDJ* Editorial Team.

Say goodbye to unreliable employees

Say hello to the latest and greatest artificial but super intelligent companion for your dental practice, RoboNurse.

Designed to complement the RoboSurgery software, RoboNurse comes in a range of heights designed to best integrate into your practice and is available in 18 different languages.

RoboNurse also comes with a quick setup guide, designed to minimise disruption during the initial charge-up and integration phase. The quick setup enables you to programme RoboNurse to discuss basic patient information after a Band 1 treatment, how to remove patient goggles and bib, a basic clean-down of work surfaces and even greetings and salutations.

Once fully programmed, RoboNurse can automatically take down notes for you to review during the treatment planning phase, picking up key words and phrases from your discussion with the patient. The software is fully compliant with regulatory standards, and automatically sends key tips to the patient's email address.

Away from the surgery RoboNurse has a range of settings for social occasions, from a quick drink down the pub to cocktails and canapés, and is enabled with phrases designed to ensure conversation with colleagues never dries up. So what are you waiting for? Get your RoboNurse today!

A game changer for all suckers

Thanks to ongoing public health communication efforts, patients are more aware than ever of the high sugar content of commonly available carbonated drinks. However, awareness of their acidic properties (with some showing pH values as low as 2.5) – and therefore their erosive potential – is less widespread.

Cylindrical Suction Enterprises Inc. is proud to announce the Stror, a unique innovation that combines the technology behind pH 'indicator strips' and the humble drinking straw to create a tool that safeguards patients' oral health against the erosion caused by acidic drinks.

Simply immersing the Stror in the patient's libation of choice produces an immediate colour change that – when referenced against a colour chart (also provided) – gives an accurate indication of the pH of the drink.

Not only does this give patients advance warning of highly acidic drinks, but also ensures that – should they decide to consume the beverage despite this warning – it is delivered past the anterior teeth, thus minimising the erosive potential of the drink.
