## Corrigendum: Effects of grazing on photosynthetic features and soil respiration of rangelands in the Tianshan Mountains of Northwest China

Hua Liu, Runguo Zang & Han Y. H. Chen

*Scientific Reports* 6:30087; doi: 10.1038/srep30087; published online 25 July 2016; updated on 30 September 2016

The original version of this Article contained typographical errors. In the Abstract,

“We found that grazing reduced the daily maximum net photosynthetic rate and soil respiration rates by 35% and 15%, respectively”.

now reads:

“We found that grazing reduced the daily maximum net photosynthetic rate and increased soil respiration rates by 35% and 15%, respectively”.

In the Results section under sub-heading ‘Soil respiration’,

“The soil respiration ( $S_r$ ) increased with time during the day while soil temperature peaked during midday in both ungrazed and grazed plots (Fig. 3).  $S_r$  in ungrazed plots was higher than that of grazed plots between 13:00 and 16:00 hours. The mean value of  $S_r$  in ungrazed plots ( $8.01 \pm 2.09 \mu \text{ mol CO}_2/\text{m}^2/\text{s}$ ) was significantly higher than in ungrazed plots ( $6.77 \pm 1.58 \mu \text{ mol CO}_2/\text{m}^2/\text{s}$ ) ( $p = 0.017$ ), while the mean values of soil temperature were significantly higher in the grazed than ungrazed plots ( $p = 0.023$ )”.

now reads:

“The soil respiration ( $S_r$ ) increased with time during the day while soil temperature peaked during midday in both ungrazed and grazed plots (Fig. 3).  $S_r$  in grazed plots was higher than that of ungrazed plots between 13:00 and 16:00 hours. The mean value of  $S_r$  in grazed plots ( $8.01 \pm 2.09 \mu \text{ mol CO}_2/\text{m}^2/\text{s}$ ) was significantly higher than in ungrazed plots ( $6.77 \pm 1.58 \mu \text{ mol CO}_2/\text{m}^2/\text{s}$ ) ( $p = 0.017$ ), while the mean values of soil temperature were significantly higher in the grazed than ungrazed plots ( $p = 0.023$ )”.

These errors have now been corrected in the PDF and HTML versions of the Article.
